### FIELD OF INVENTION

15

20

25

The present invention relates to a series of compounds that are potent and selective inhibitors of cyclic adenosine 3',5'-monophosphate specific phosphodiesterase (cAMP specific PDE). In particular, the present invention relates to a series of novel pyrrolidine compounds that are useful for inhibiting the function of cAMP specific PDE, in particular, PDE4, as well as methods of making the same, pharmaceutical compositions containing the same, and their use as therapeutic agents, for example, in treating inflammatory diseases and other diseases involving elevated levels of cytokines and proinflammatory mediators.

### BACKGROUND OF THE INVENTION

30

Chronic inflammation is a multi-factorial disease complication characterized by activation of multiple types of inflammatory cells, particularly cells of lymphoid lineage (including T lymphocytes) and myeloid lineage (including granulocytes, macrophages, and monocytes). Proinflammatory mediators,

including cytokines, such as tumor necrosis factor (TNF) and interleukin-1 (IL-1), are produced by these activated cells. Accordingly, an agent that suppresses the activation of these cells, or their  
5 production of proinflammatory cytokines, would be useful in the therapeutic treatment of inflammatory diseases and other diseases involving elevated levels of cytokines.

Cyclic adenosine monophosphate (cAMP) is a  
10 second messenger that mediates the biologic responses of cells to a wide range of extracellular stimuli. When the appropriate agonist binds to specific cell surface receptors, adenylate cyclase is activated to convert adenosine triphosphate (ATP)  
15 to cAMP. It is theorized that the agonist induced actions of cAMP within the cell are mediated predominantly by the action of cAMP-dependent protein kinases. The intracellular actions of cAMP are terminated by either a transport of the nucleotide  
20 to the outside of the cell, or by enzymatic cleavage by cyclic nucleotide phosphodiesterases (PDEs), which hydrolyze the 3'-phosphodiester bond to form 5'-adenosine monophosphate (5'-AMP). 5'-AMP is an inactive metabolite. The structures of cAMP and 5'-  
25 AMP are illustrated below.

cAMP

25 5'-AMP

Elevated levels of cAMP in human myeloid and lymphoid lineage cells are associated with the suppression of cell activation. The intracellular enzyme family of PDEs, therefore, regulates the level of cAMP in cells. PDE4 is a predominant PDE isotype in these cells, and is a major contributor to cAMP degradation. Accordingly, the inhibition of

PDE function would prevent the conversion of cAMP to the inactive metabolite 5'-AMP and, consequently, maintain higher cAMP levels, and, accordingly, suppress cell activation (see Beavo et al., "Cyclic Nucleotide Phosphodiesterases: Structure, Regulation and Drug Action," Wiley and Sons, Chichester, pp. 3-14, (1990)); Torphy et al., *Drug News and Perspectives*, 6, pp. 203-214 (1993); Giembycz et al., *Clin. Exp. Allergy*, 22, pp. 337-344 (1992)).

10 In particular, PDE4 inhibitors, such as rolipram, have been shown to inhibit production of TNF $\alpha$  and partially inhibit IL-1 $\beta$  release by monocytes (see Semmler et al., *Int. J. Immunopharmacol.*, 15, pp. 409-413, (1993); Molnar-Kimber et al.,  
15 *Mediators of Inflammation*, 1, pp. 411-417, (1992)). PDE4 inhibitors also have been shown to inhibit the production of superoxide radicals from human polymorphonuclear leukocytes (see Verghese et al., *J. Mol. Cell. Cardiol.*, 21 (Suppl. 2), S61 (1989);  
20 Nielson et al., *J. Allergy Immunol.*, 86, pp. 801-808, (1990)); to inhibit the release of vasoactive amines and prostanoids from human basophils (see Peachell et al., *J. Immunol.*, 148, pp. 2503-2510, (1992)); to inhibit respiratory bursts in eosino-  
25 phils (see Dent et al., *J. Pharmacol.*, 103, pp. 1339-1346, (1991)); and to inhibit the activation of human T-lymphocytes (see Robicsek et al., *Biochem. Pharmacol.*, 42, pp. 869-877, (1991)).

Inflammatory cell activation and excessive  
30 or unregulated cytokine (e.g., TNF $\alpha$  and IL-1 $\beta$ ) production are implicated in allergic, autoimmune, and inflammatory diseases and disorders, such as rheuma-

toid arthritis, osteoarthritis, gouty arthritis, spondylitis, thyroid associated ophthalmopathy, Behcet's disease, sepsis, septic shock, endotoxic shock, gram negative sepsis, gram positive sepsis, 5 toxic shock syndrome, asthma, chronic bronchitis, adult respiratory distress syndrome, chronic pulmonary inflammatory disease, such as chronic obstructive pulmonary disease, silicosis, pulmonary sarcoidosis, reperfusion injury of the myocardium, brain, 10 and extremities, fibrosis, cystic fibrosis, keloid formation, scar formation, atherosclerosis, transplant rejection disorders, such as graft vs. host reaction and allograft rejection, chronic glomerulonephritis, lupus, inflammatory bowel disease, such 15 as Crohn's disease and ulcerative colitis, proliferative lymphocyte diseases, such as leukemia, and inflammatory dermatoses, such as atopic dermatitis, psoriasis, and urticaria.

Other conditions characterized by elevated 20 cytokine levels include brain injury due to moderate trauma (see Dhillon et al., *J. Neurotrauma*, 12, pp. 1035-1043 (1995); Suttorp et al., *J. Clin. Invest.*, 91, pp. 1421-1428 (1993)), cardiomyopathies, such as congestive heart failure (see Bristow et al., *Circulation*, 97, pp. 1340-1341 (1998)), cachexia, cachexia 25 secondary to infection or malignancy, cachexia secondary to acquired immune deficiency syndrome (AIDS), ARC (AIDS related complex), fever myalgias due to infection, cerebral malaria, osteoporosis and 30 bone resorption diseases, keloid formation, scar tissue formation, and pyrexia.

In particular, TNF $\alpha$  has been identified as having a role with respect to human acquired immune

deficiency syndrome (AIDS). AIDS results from the infection of T-lymphocytes with Human Immunodeficiency Virus (HIV). Although HIV also infects and is maintained in myeloid lineage cells, TNF has been shown to upregulate HIV infection in T-lymphocytic and monocytic cells (see Poli et al., *Proc. Natl. Acad. Sci. USA*, 87, pp. 782-785, (1990)).

Several properties of  $\text{TNF}\alpha$ , such as stimulation of collagenases, stimulation of angiogenesis in vivo, stimulation of bone resorption, and an ability to increase the adherence of tumor cells to endothelium, are consistent with a role for TNF in the development and metastatic spread of cancer in the host.  $\text{TNF}\alpha$  recently has been directly implicated in the promotion of growth and metastasis of tumor cells (see Orosz et al., *J. Exp. Med.*, 177, pp. 1391-1398, (1993)).

PDE4 has a wide tissue distribution. There are at least four genes for PDE4 of which multiple transcripts from any given gene can yield several different proteins that share identical catalytic sites. The amino acid identity between the four possible catalytic sites is greater than 85%. Their shared sensitivity to inhibitors and their kinetic similarity reflect the functional aspect of this level of amino acid identity. It is theorized that the role of these alternatively expressed PDE4 proteins allows a mechanism by which a cell can differentially localize these enzymes intracellularly and/or regulate the catalytic efficiency via post translational modification. Any given cell type that expresses the PDE4 enzyme typi-

cally expresses more than one of the four possible genes encoding these proteins.

Investigators have shown considerable interest in the use of PDE4 inhibitors as anti-inflammatory agents. Early evidence indicates that PDE4 inhibition has beneficial effects on a variety of inflammatory cells such as monocytes, macrophages, T-cells of the Th-1 lineage, and granulocytes. The synthesis and/or release of many proinflammatory mediators, such as cytokines, lipid mediators, superoxide, and biogenic amines, such as histamine, have been attenuated in these cells by the action of PDE4 inhibitors. The PDE4 inhibitors also affect other cellular functions including T-cell proliferation, granulocyte transmigration in response to chemotoxic substances, and integrity of endothelial cell junctions within the vasculature.

The design, synthesis, and screening of various PDE4 inhibitors have been reported. Methylxanthines, such as caffeine and theophylline, were the first PDE inhibitors discovered, but these compounds are nonselective with respect to which PDE is inhibited. The drug rolipram, an antidepressant agent, was one of the first reported specific PDE4 inhibitors. Rolipram, having the following structural formula, has a reported 50% Inhibitory Concentration ( $IC_{50}$ ) of about 200 nM (nanomolar) with respect to inhibiting recombinant human PDE4.

Rolipram

10                    Investigators have continued to search for  
PDE4 inhibitors that are more selective with respect  
to inhibiting PDE4, that have a lower  $IC_{50}$  than  
rolipram, and that avoid the undesirable central  
nervous system (CNS) side effects, such as retching,  
15    vomiting, and sedation, associated with the adminis-  
tration of rolipram. One class of compounds is dis-  
closed in Feldman et al. U.S. Patent No. 5,665,754.  
The compounds disclosed therein are substituted  
pyrrolidines having a structure similar to rolipram.  
20    One particular compound, having structural formula  
(I), has an  $IC_{50}$  with respect to human recombinant  
PDE4 of about 2 nM. Inasmuch as a favorable separa-  
tion of emetic side effect from efficacy was ob-  
served, these compounds did not exhibit a reduction  
25    in undesirable CNS effects.

(I)

10           In addition, several companies are now  
undertaking clinical trials of other PDE4 inhibi-  
tors. However, problems relating to efficacy and  
adverse side effects, such as emesis and central  
nervous system disturbances, remain unsolved.

15           Accordingly, compounds that selectively  
inhibit PDE4, and that reduce or eliminate the ad-  
verse CNS side effects associated with prior PDE4  
inhibitors, would be useful in the treatment of  
allergic and inflammatory diseases, and other dis-  
20   eases associated with excessive or unregulated pro-  
duction of cytokines, such as TNF. In addition,  
selective PDE4 inhibitors would be useful in the  
treatment of diseases that are associated with ele-  
vated cAMP levels or PDE4 function in a particular  
25   target tissue.

#### SUMMARY OF THE INVENTION

30           The present invention is directed to  
potent and selective PDE4 inhibitors useful in  
treatment of diseases and conditions where inhibi-  
tion of PDE4 activity is considered beneficial. The  
present PDE4 inhibitors unexpectedly reduce or elim-

inate the adverse CNS side effects associated with prior PDE4 inhibitors.

In particular, the present invention is directed to pyrrolidine compounds having the structural formula (II):

salts and solvates (e.g., hydrates) thereof.

As used herein, the term "alkyl," alone or in combination, is defined to include straight chain and branched chain saturated hydrocarbon groups containing one to 16 carbon atoms, either substituted or unsubstituted. The term "lower alkyl" is defined herein as an alkyl group having one through six carbon atoms (C<sub>1</sub>-C<sub>6</sub>). Examples of lower alkyl groups include, but are not limited to, methyl, ethyl, n-propyl, isopropyl, isobutyl, tertiary butyl, isopentyl, n-butyl, neopentyl, n-hexyl, and the like. The term "alkynyl" refers to an unsaturated alkyl group that contains a carbon-carbon triple bond.

The term "bridged alkyl" is defined herein as a C<sub>6</sub>-C<sub>16</sub> bicyclic or polycyclic hydrocarbon group, for example, norbornyl, adamantyl, bicyclo[2.2.2]octyl, bicyclo[2.2.1]heptyl, bicyclo[3.2.1]octyl, bicyclo[4.1.0]heptyl, bicyclo[3.1.0]hexyl, and decahydronaphthyl, substituted or unsubstituted.

The term "cycloalkyl" is defined herein to include monocyclic or fused polycyclic C<sub>3</sub>-C<sub>10</sub> aliphatic hydrocarbon groups. Examples of cycloalkyl groups include, but are not limited to, cyclopropyl, cyclobutyl, cyclohexyl, decahydronaphthylene, and cyclopentyl. As used herein, "cycloalkyl" also encompasses cyclic C<sub>3</sub>-C<sub>10</sub> aliphatic hydrocarbon groups

fused to an aryl ring. For example, indanyl and tetrahydronaphthalenyl are cycloalkyl groups as defined herein.

5 An alkyl, bridged alkyl, or cycloalkyl group optionally can be substituted with one or more, typically one to three, substituents, for example, lower alkyl, cycloalkyl, haloalkyl, e.g.,  $\text{CF}_3$ -, halo, hydroxy, alkoxy, aryl, heteroaryl, and Het.

10 The term "alkylene" refers to an alkyl group having a substituent. For example, the term " $\text{C}_{1-3}$ alkylenecycloalkyl" refers to an alkyl group containing one to three carbon atoms, and substituted with a cycloalkyl group. An example of  
15 " $\text{C}_{1-3}$ alkylenearyl" is benzyl.

The term "haloalkyl" is defined herein as an alkyl group substituted with one or more halo substituents, either fluoro, chloro, bromo, iodo, or combinations thereof. Similarly, "halocycloalkyl"  
20 and "haloaryl" are defined as a cycloalkyl or an aryl group having one or more halo substituents.

The term "aryl," alone or in combination, is defined herein as a monocyclic or polycyclic aromatic group, preferably a monocyclic or bicyclic  
25 aromatic group, e.g., phenyl or naphthyl, that can be unsubstituted or substituted, for example, with one or more, and in particular one to three, substituents selected from halo, alkyl, phenyl, substituted phenyl, hydroxy, hydroxyalkyl, alkoxy, aryl-  
30 oxy, alkoxyalkyl, haloalkyl, nitro, amino, alkylamino, acylamino, alkylthio, alkylsulfinyl, and alkylsulfonyl. Exemplary aryl groups include phenyl, naphthyl, biphenyl, tetrahydronaphthyl,

indanyl, 2-chlorophenyl, 3-chlorophenyl, 4-chlorophenyl, 4-fluorophenyl, 2-methylphenyl, 4-methoxyphenyl, 4-trifluoromethylphenyl, 4-nitrophenyl, and the like.

5           The term "heteroaryl" is defined herein as a monocyclic or bicyclic ring system containing one or two aromatic rings and containing at least one nitrogen, oxygen, or sulfur atom in an aromatic ring, and which can be unsubstituted or substituted,  
10   for example, with one or more, and in particular one to three, substituents, like halo, alkyl, hydroxy, hydroxyalkyl, alkoxy, alkoxyalkyl, haloalkyl, aryl, haloaryl, nitro, amino, alkylamino, acylamino, alkylthio, alkylsulfinyl, and alkylsulfonyl. Exam-  
15   ples of heteroaryl groups include thienyl, furyl, pyridyl, oxazolyl, 1,2,4-oxadiazol-3-yl, quinolyl, isoquinolyl, indolyl, triazolyl, isothiazolyl, isoxazolyl, imidizolyl, benzothiazolyl, pyrazinyl, pyrimidinyl, thiazolyl, and thiadiazolyl.

20           The terms "heterocycle" and "Het" are defined as a 4-, 5-, or 6-membered nonaromatic ring having one or more, typically one to three, heteroatoms selected from oxygen, nitrogen, and sulfur present in the ring, and optionally substituted with  
25   alkyl, halo, aryl, alkoxy, C<sub>1-3</sub>alkyleneHet, C<sub>1-3</sub>alkyleneamino, C<sub>1-3</sub>alkylenealkylamino, and haloaryl. Nonlimiting examples include tetrahydrofuran, tetrahydropyran, piperidine, piperazine, sulfolane, morpholine, 1,3-dioxolane, tetrahydropyran, dioxane,  
30   trimethyleneoxide, and the like.

          The term "halogen" or "halo" is defined herein to include fluorine, chlorine, bromine, and iodine.

The term "alkoxy" and "aryloxy" are defined as -OR, wherein R is alkyl or aryl, respectively.

5 The term "alkoxyalkyl" is defined as an alkoxy group appended to an alkyl group.

The term "propargyl" is defined as  $R-C\equiv C-CH_2-$ , wherein R is hydrogen, lower alkyl, haloalkyl, cycloalkyl, substituted or unsubstituted aryl, or substituted or unsubstituted heteroaryl.

10 The term "allyl" is defined as  $R-CH=CHCH_2-$ , wherein R is hydrogen, lower alkyl, haloalkyl, cycloalkyl, substituted or unsubstituted aryl, or substituted or unsubstituted heteroaryl.

The term "hydroxy" is defined as -OH.

15 The term "hydroxyalkyl" is defined as a hydroxy group appended to an alkyl group.

The term "amino" is defined as  $-NH_2$ .

The term "alkylamino" is defined as  $-NR_2$  wherein at least one R is alkyl and the second R is  
20 alkyl or hydrogen.

The term "acylamino" is defined as  $RC(=O)NH$ , wherein R is alkyl or aryl.

The term "nitro" is defined as  $-NO_2$ .

The term "alkylthio" is defined as  $-SR$ ,  
25 where R is alkyl.

The term "alkylsulfinyl" is defined as  $R-S(O)_2$ , where R is alkyl.

The term "alkylsulfonyl" is defined as  $R-S(O)_2$ , where R is alkyl.

30 In preferred embodiments,  $R^5$  is methyl,  $R^7$  is methyl or benzyl,  $R^2$  is methyl or difluoromethyl,  $R^4$  is selected from the group consisting of hydrogen, methyl, trifluoromethyl, cyclopropyl, benzyl, and

phenyl, and  $R^6$  is selected from the group consisting of hydrogen, acetyl, and benzoyl. Preferably,  $R^1$  is selected from the group consisting of

The present invention includes all possi-  
ble stereoisomers and geometric isomers of compounds  
25 of structural formula (II), and includes not only  
racemic compounds but also the optically active  
isomers as well. When a compound of structural  
formula (II) is desired as a single enantiomer, it  
can be obtained either by resolution of the final  
30 product or by stereospecific synthesis from either  
isomerically pure starting material or use of a  
chiral auxiliary reagent, for example, see Z. Ma et  
al., *Tetrahedron: Asymmetry*, 8(6), pages 883-888

(1997). Resolution of the final product, an intermediate, or a starting material can be achieved by any suitable method known in the art. Additionally, in situations where tautomers of the compounds of structural formula (II) are possible, the present invention is intended to include all tautomeric forms of the compounds. As demonstrated hereafter, specific stereoisomers exhibit an exceptional ability to inhibit PDE4 without manifesting the adverse CNS side effects typically associated with PDE4 inhibitors.

In particular, it is generally accepted that biological systems can exhibit very sensitive activities with respect to the absolute stereochemical nature of compounds. (See, E.J. Ariens, *Medicinal Research Reviews*, 6:451-466 (1986); E.J. Ariens, *Medicinal Research Reviews*, 7:367-387 (1987); K.W. Fowler, *Handbook of Stereoisomers: Therapeutic Drugs*, CRC Press, edited by Donald P. Smith, pp. 35-63 (1989); and S.C. Stinson, *Chemical and Engineering News*, 75:38-70 (1997).)

For example, rolipram is a stereospecific PDE4 inhibitor that contains one chiral center. The (-)-enantiomer of rolipram has a higher pharmacological potency than the (+)-enantiomer, which could be related to its potential antidepressant action. Schultz et al., *Naunyn-Schmiedeberg's Arch Pharmacol*, 333:23-30 (1986). Furthermore, the metabolism of rolipram appears stereospecific with the (+)-enantiomer exhibiting a faster clearance rate than the (-)-enantiomer. Krause et al., *Xenobiotica*, 18:561-571 (1988). Finally, a recent observation indicated that the (-)-enantiomer of rolipram

(R-rolipram) is about ten-fold more emetic than the (+)-enantiomer (S-rolipram). A. Robichaud et al., *Neuropharmacology*, 38:289-297 (1999). This observation is not easily reconciled with differences in  
5 test animal disposition to rolipram isomers and the ability of rolipram to inhibit the PDE4 enzyme. The compounds of the present invention can have three or more chiral centers. As shown below, compounds of a specific stereochemical orientation exhibit similar  
10 PDE4 inhibitory activity and pharmacological activity, but altered CNS toxicity and emetic potential.

Accordingly, preferred compounds of the present invention have the structural formula (III):

(III)

The compounds of structural formula (III) are potent  
25 and selective PDE4 inhibitors, and do not manifest the adverse CNS effects and emetic potential demonstrated by stereoisomers of a compound of structural formula (III).

Compounds of structural formula (II) which  
30 contain acidic moieties can form pharmaceutically acceptable salts with suitable cations. Suitable pharmaceutically acceptable cations include alkali metal (e.g., sodium or potassium) and alkaline earth

metal (e.g., calcium or magnesium) cations. The pharmaceutically acceptable salts of the compounds of structural formula (II), which contain a basic center, are acid addition salts formed with pharmaceutically acceptable acids. Examples include the hydrochloride, hydrobromide, sulfate or bisulfate, phosphate or hydrogen phosphate, acetate, benzoate, succinate, fumarate, maleate, lactate, citrate, tartrate, gluconate, methanesulfonate, benzene-sulphonate, and p-toluenesulphonate salts. In light of the foregoing, any reference to compounds of the present invention appearing herein is intended to include compounds of structural formula (II), as well as pharmaceutically acceptable salts and solvates thereof.

The compounds of the present invention can be therapeutically administered as the neat chemical, but it is preferable to administer compounds of structural formula (II) as a pharmaceutical composition or formulation. Accordingly, the present invention further provides for pharmaceutical formulations comprising a compound of structural formula (II), together with one or more pharmaceutically acceptable carriers and, optionally, other therapeutic and/or prophylactic ingredients. The carriers are "acceptable" in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

In particular, a selective PDE4 inhibitor of the present invention is useful alone or in combination with a second antiinflammatory therapeutic agent, for example, a therapeutic agent targeting TNF $\alpha$ , such as ENBREL<sup>®</sup> or REMICADE<sup>®</sup>, which

have utility in treating rheumatoid arthritis. Likewise, therapeutic utility of IL-1 antagonism has also been shown in animal models for rheumatoid arthritis. Thus, it is envisioned that IL-1  
5 antagonism, in combination with PDE4 inhibition, which attenuates TNF $\alpha$ , would be efficacious.

The present PDE4 inhibitors are useful in the treatment of a variety of allergic, autoimmune, and inflammatory diseases.

10 The term "treatment" includes preventing, lowering, stopping, or reversing the progression of severity of the condition or symptoms being treated. As such, the term "treatment" includes both medical therapeutic and/or prophylactic administration, as  
15 appropriate.

In particular, inflammation is a localized, protective response elicited by injury or destruction of tissues, which serves to destroy, dilute or wall off (i.e., sequester) both the inju-  
20 rious agent and the injured tissue. The term "inflammatory disease," as used herein, means any disease in which an excessive or unregulated inflammatory response leads to excessive inflammatory symptoms, host tissue damage, or loss of tissue func-  
25 tion. Additionally, the term "autoimmune disease," as used herein, means any group of disorders in which tissue injury is associated with humoral or cell-mediated responses to the body's own constituents. The term "allergic disease," as used herein,  
30 means any symptoms, tissue damage, or loss of tissue function resulting from allergy. The term "arthritic disease," as used herein, means any of a large family of diseases that are characterized by inflam-

matory lesions of the joints attributable to a variety of etiologies. The term "dermatitis," as used herein, means any of a large family of diseases of the skin that are characterized by inflammation of the skin attributable to a variety of etiologies. 5 The term "transplant rejection," as used herein, means any immune reaction directed against grafted tissue (including organ and cell (e.g., bone marrow)), characterized by a loss of function of the grafted and surrounding tissues, pain, swelling, 10 leukocytosis and thrombocytopenia.

The present invention also provides a method of modulating cAMP levels in a mammal, as well as a method of treating diseases characterized by elevated cytokine levels. 15

The term "cytokine," as used herein, means any secreted polypeptide that affects the functions of other cells, and that modulates interactions between cells in the immune or inflammatory response. Cytokines include, but are not limited to 20 monokines, lymphokines, and chemokines regardless of which cells produce them. For instance, a monokine is generally referred to as being produced and secreted by a monocyte, however, many other cells produce monokines, such as natural killer cells, 25 fibroblasts, basophils, neutrophils, endothelial cells, brain astrocytes, bone marrow stromal cells, epidermal keratinocytes, and B-lymphocytes. Lymphokines are generally referred to as being produced by lymphocyte cells. Examples of cytokines include, 30 but are not limited to, interleukin-1 (IL-1), interleukin-6 (IL-6), Tumor Necrosis Factor alpha (TNF $\alpha$ ), and Tumor Necrosis Factor beta (TNF $\beta$ ).

The present invention further provides a method of reducing TNF levels in a mammal, which comprises administering an effective amount of a compound of structural formula (II) to the mammal.

5 The term "reducing TNF levels," as used herein, means either:

a) decreasing excessive *in vivo* TNF levels in a mammal to normal levels or below normal levels by inhibition of the *in vivo* release of TNF  
10 by all cells, including but not limited to monocytes or macrophages; or

b) inducing a down-regulation, at the translational or transcription level, of excessive *in vivo* TNF levels in a mammal to normal levels or  
15 below normal levels; or

c) inducing a down-regulation, by inhibition of the direct synthesis of TNF as a postranslational event.

Moreover, the compounds of the present  
20 invention are useful in suppressing inflammatory cell activation. The term "inflammatory cell activation," as used herein, means the induction by a stimulus (including, but not limited to, cytokines, antigens or auto-antibodies) of a proliferative  
25 cellular response, the production of soluble mediators (including but not limited to cytokines, oxygen radicals, enzymes, prostanoids, or vasoactive amines), or cell surface expression of new or increased numbers of mediators (including, but not  
30 limited to, major histocompatibility antigens or cell adhesion molecules) in inflammatory cells (including but not limited to monocytes, macrophages, T lymphocytes, B lymphocytes, granulocytes, poly-

morphonuclear leukocytes, mast cells, basophils, eosinophils, dendritic cells, and endothelial cells). It will be appreciated by persons skilled in the art that the activation of one or a combination of these phenotypes in these cells can contribute to the initiation, perpetuation, or exacerbation of an inflammatory condition.

The compounds of the present invention also are useful in causing airway smooth muscle relaxation, bronchodilation, and prevention of bronchoconstriction.

The compounds of the present invention, therefore, are useful in treating such diseases as arthritic diseases (such as rheumatoid arthritis), osteoarthritis, gouty arthritis, spondylitis, thyroid-associated ophthalmopathy, Behcet disease, sepsis, septic shock, endotoxic shock, gram negative sepsis, gram positive sepsis, toxic shock syndrome, asthma, chronic bronchitis, allergic rhinitis, allergic conjunctivitis, vernal conjunctivitis, eosinophilic granuloma, adult (acute) respiratory distress syndrome (ARDS), chronic pulmonary inflammatory disease (such as chronic obstructive pulmonary disease), silicosis, pulmonary sarcoidosis, reperfusion injury of the myocardium, brain or extremities, brain or spinal cord injury due to minor trauma, fibrosis including cystic fibrosis, keloid formation, scar tissue formation, atherosclerosis, autoimmune diseases, such as systemic lupus erythematosus (SLE) and transplant rejection disorders (e.g., graft vs. host (GvH) reaction and allograft rejection), chronic glomerulonephritis, inflammatory bowel diseases, such as Crohn's disease

and ulcerative colitis, proliferative lymphocytic diseases, such as leukemias (e.g. chronic lymphocytic leukemia; CLL) (see Mentz et al., *Blood* 88, pp. 2172-2182 (1996)), and inflammatory dermatoses, such as atopic dermatitis, psoriasis, or urticaria.

The compounds of the present invention also are useful in the treatment of obesity, alone or in combination with a PDE3 inhibitor, and in the treatment and prevention of nephropathy in Type 2 diabetes (see Mora et al., *New England Journal of Medicine*, 342, p. 441 (2000)). PDE3 inhibitors are known to persons skilled in the art.

Other examples of such diseases or related conditions include cardiomyopathies, such as congestive heart failure, pyrexia, cachexia, cachexia secondary to infection or malignancy, cachexia secondary to acquired immune deficiency syndrome (AIDS), ARC (AIDS-related complex), cerebral malaria, osteoporosis and bone resorption diseases, and fever and myalgias due to infection. In addition, the compounds of the present invention are useful in the treatment of erectile dysfunction, especially vasculogenic impotence (Doherty, Jr. et al. U.S. Patent No. 6,127,363), diabetes insipidus and central nervous system disorders, such as depression and multi-infarct dementia.

Compounds of the present invention also have utility outside of that typically known as therapeutic. For example, the present compounds can function as organ transplant preservatives (see Pinsky et al., *J. Clin. Invest.*, 92, pp. 2994-3002 (1993)) as well.

Selective PDE4 inhibitors also can be useful in the treatment of erectile dysfunction, especially vasculogenic impotence (Doherty, Jr. et al. U.S. Patent No. 6,127,363), diabetes insipidus (Kidney Int., 37, p. 362, (1990); Kidney Int., 35, p. 494, (1989)), and central nervous system disorders, such as multiinfarct dementia (Nicholson, Psychopharmacology, 101, p. 147 (1990)), depression (Eckman et al., Curr. Ther. Res., 43, p. 291 (1988)), anxiety and stress responses (Neuropharmacology, 38, p. 1831 (1991)), cerebral ischemia (Eur. J. Pharmacol., 272, p. 107 (1995)), tardive dyskinesia (J. Clin. Pharmacol., 16, p. 304 (1976)), Parkinson's disease (see Neurology, 25, p. 722 (1975); Clin. Exp. Pharmacol, Physiol., 26, p. 421 (1999)), and premenstrual syndrome. With respect to depression, PDE4-selective inhibitors show efficacy in a variety of animal models of depression such as the "behavioral despair" or Porsolt tests (Eur. J. Pharmacol., 47, p. 379 (1978); Eur. J. Pharmacol., 57, p. 431 (1979); Antidepressants: neurochemical, behavioral and clinical perspectives, Enna, Malick, and Richelson, eds., Raven Press, p. 121 (1981)), and the "tail suspension test" (Psychopharmacology, 85, p. 367 (1985)). Recent research findings show that chronic in vivo treatment by a variety of antidepressants increase the brain-derived expression of PDE4 (J. Neuroscience, 19, p. 610 (1999)). Therefore, a selective PDE4 inhibitor can be used alone or in conjunction with a second therapeutic agent in a treatment for the four major classes of antidepressants: electroconvulsive procedures, monoamine

oxidase inhibitors, and selective reuptake inhibitors of serotonin or norepinephrine. Selective PDE4 inhibitors also can be useful in applications that modulate bronchodilatory activity via direct action  
5 on bronchial smooth muscle cells for the treatment of asthma.

The selective PDE4 inhibitors of the present invention also can be used in the treatment of infertility in both females and males. The present  
10 PDE4 inhibitors elevate cAMP levels within granulosa cells, and thereby enhance gonadotropin induction of ovulation and oocyte maturation (Tsafriri et al., *Dev. Biol.*, 178, pp. 393-402 (1996)). Furthermore, the present PDE4 inhibitors can be used in treat-  
15 ments for infertile couples having abnormal semen parameters by enhancing sperm motility without affecting the acrosome reaction (see Fosch et al., *Hum. Reprod.*, 13, pp. 1248-1254 (1998)).

Compounds and pharmaceutical compositions  
20 suitable for use in the present invention include those wherein the active ingredient is administered to a mammal in an effective amount to achieve its intended purpose. More specifically, a "therapeutically effective amount" means an amount effective  
25 to prevent development of, or to alleviate the existing symptoms of, the subject being treated. Determination of the effective amounts is well within the capability of those skilled in the art, especially in light of the detailed disclosure  
30 provided herein.

The term "mammal" as used herein includes males and females, and encompasses humans, domestic animals (e.g., cats, dogs), livestock (e.g., cattle,

horses, swine), and wildlife (e.g., primates, large cats, zoo specimens).

A "therapeutically effective dose" refers to that amount of the compound that results in achieving the desired effect. Toxicity and therapeutic efficacy of such compounds can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., for determining the LD<sub>50</sub> (the dose lethal to 50% of the population) and the ED<sub>50</sub> (the dose therapeutically effective in 50% of the population). The dose ratio between toxic and therapeutic effects is the therapeutic index, which is expressed as the ratio between LD<sub>50</sub> and ED<sub>50</sub>. Compounds which exhibit high therapeutic indices are preferred. The data obtained from such data can be used in formulating a dosage range for use in humans. The dosage of such compounds preferably lies within a range of circulating concentrations that include the ED<sub>50</sub> with little or no toxicity. The dosage can vary within this range depending upon the dosage form employed, and the route of administration utilized.

The exact formulation, route of administration, and dosage can be chosen by the individual physician in view of the patient's condition. Dosage amount and interval can be adjusted individually to provide plasma levels of the active moiety which are sufficient to maintain the therapeutic effects.

As appreciated by persons skilled in the art, reference herein to treatment extends to prophylaxis, as well as to treatment of established diseases or symptoms. It is further appreciated that the amount of a compound of the invention re-

quired for use in treatment varies with the nature of the condition being treated, and with the age and the condition of the patient, and is ultimately determined by the attendant physician or veterinarian. In general, however, doses employed for adult human treatment typically are in the range of 0.001 mg/kg to about 100 mg/kg per day. The desired dose can be conveniently administered in a single dose, or as multiple doses administered at appropriate intervals, for example as two, three, four or more subdoses per day. In practice, the physician determines the actual dosing regimen which is most suitable for an individual patient, and the dosage varies with the age, weight, and response of the particular patient. The above dosages are exemplary of the average case, but there can be individual instances in which higher or lower dosages are merited, and such are within the scope of the present invention.

Formulations of the present invention can be administered in a standard manner for the treatment of the indicated diseases, such as orally, parenterally, transmucosally (e.g., sublingually or via buccal administration), topically, transdermally, rectally, via inhalation (e.g., nasal or deep lung inhalation). Parenteral administration includes, but is not limited to intravenous, intra-arterial, intraperitoneal, subcutaneous, intramuscular, intrathecal, and intraarticular. Parenteral administration also can be accomplished using a high pressure technique, like POWDERJECT™.

For buccal administration, the composition can be in the form of tablets or lozenges formulated

in conventional manner. For example, tablets and capsules for oral administration can contain conventional excipients such as binding agents (for example, syrup, accacia, gelatin, sorbitol, tragacanth, 5 mucilage of starch or polyvinylpyrrolidone), fillers (for example, lactose, sugar, microcrystalline, cellulose, maize-starch, calcium phosphate or sorbitol), lubricants (for example, magnesium, stearate, stearic acid, talc, polyethylene glycol or silica), 10 disintegrants (for example, potato starch or sodium starch glycollate), or wetting agents (for example, sodium lauryl sulfate). The tablets can be coated according to methods well known in the art.

Alternatively, the compounds of the present 15 invention can be incorporated into oral liquid preparations such as aqueous or oily suspensions, solutions, emulsions, syrups, or elixirs, for example. Moreover, formulations containing these compounds can be presented as a dry product for constitution 20 with water or other suitable vehicle before use. Such liquid preparations can contain conventional additives, such as suspending agents, such as sorbitol syrup, methyl cellulose, glucose/sugar syrup, gelatin, hydroxyethylcellulose, hydroxypropylmethylcellulose, carboxymethyl cellulose, 25 aluminum stearate gel, and hydrogenated edible fats; emulsifying agents, such as lecithin, sorbitan monooleate, or acacia; nonaqueous vehicles (which can include edible oils), such as almond oil, fractionated coconut oil, oily esters, propylene glycol, and 30 ethyl alcohol; and preservatives, such as methyl or propyl p-hydroxybenzoate and sorbic acid.

Such preparations also can be formulated as suppositories, e.g., containing conventional suppository bases, such as cocoa butter or other glycerides. Compositions for inhalation typically  
5 can be provided in the form of a solution, suspension, or emulsion that can be administered as a dry powder or in the form of an aerosol using a conventional propellant, such as dichlorodifluoromethane or trichlorofluoromethane. Typical topical and  
10 transdermal formulations comprise conventional aqueous or nonaqueous vehicles, such as eye drops, creams, ointments, lotions, and pastes, or are in the form of a medicated plaster, patch, or membrane.

Additionally, compositions of the present  
15 invention can be formulated for parenteral administration by injection or continuous infusion. Formulations for injection can be in the form of suspensions, solutions, or emulsions in oily or aqueous vehicles, and can contain formulation agents, such  
20 as suspending, stabilizing, and/or dispersing agents. Alternatively, the active ingredient can be in powder form for constitution with a suitable vehicle (e.g., sterile, pyrogen-free water) before use.

25 A composition in accordance with the present invention also can be formulated as a depot preparation. Such long acting formulations can be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular  
30 injection. Accordingly, the compounds of the invention can be formulated with suitable polymeric or hydrophobic materials (e.g., an emulsion in an acceptable oil), ion exchange resins, or as sparingly

soluble derivatives (e.g., a sparingly soluble salt).

For veterinary use, a compound of formula (II), or nontoxic salts thereof, is administered as  
5 a suitably acceptable formulation in accordance with normal veterinary practice. The veterinarian can readily determine the dosing regimen and route of administration that is most appropriate for a particular animal.

10 Thus, the invention provides in a further aspect a pharmaceutical composition comprising a compound of the formula (II), together with a pharmaceutically acceptable diluent or carrier therefor. There is further provided by the present  
15 invention a process of preparing a pharmaceutical composition comprising a compound of formula (II), which process comprises mixing a compound of formula (II), together with a pharmaceutically acceptable diluent or carrier therefor.

20 Specific, nonlimiting examples of compounds of structural formula (II) are provided below, the synthesis of which were performed in accordance with the procedures set forth below.

Generally, compounds of structural formula  
25 (II) can be prepared according to the following synthetic schemes. In each scheme described below, it is understood in the art that protecting groups can be employed where necessary in accordance with general principles of synthetic chemistry. These  
30 protecting groups are removed in the final steps of the synthesis under basic, acidic, or hydrogenolytic conditions which are readily apparent to those skilled in the art. By employing appropriate manip-

ulation and protection of any chemical functionalities, synthesis of compounds of structural formula (II) not specifically set forth herein can be accomplished by methods analogous to the schemes set forth below.

Unless otherwise noted, all starting materials were obtained from commercial suppliers and used without further purification. All reactions and chromatography fractions were analyzed by thin-layer chromatography on 250-mm silica gel plates, visualized with UV (ultraviolet) light  $I_2$  (iodine) stain. Products and intermediates were purified by flash chromatography, or reverse-phase HPLC.

The compounds of general structural formula (II) can be prepared, for example, by first reacting a disubstituted benzaldehyde (1) with 2-butanone, then following the reaction scheme illustrated below. Other synthetic routes also are known and available to persons skilled in the art. For example, see Feldman et al. U.S. Patent No. 5,665,754, incorporated herein by reference, for various individual reactions, and the synthetic methods disclosed in the Intermediates and Examples presented hereafter.

10 The above reaction scheme provides a compound (5) of structural formula (II), wherein  $R^1$  and  $R^2$  are determined by the starting benzaldehyde,  $R^3$  is  $C(=O)OCH_3$ ,  $R^4$  is hydrogen,  $R^5$  is methyl,  $R^6$  is hydrogen, and  $R^7$  is methyl, and  $R^{10}$  is hydrogen. Proper selection of  
15 starting materials, or performing conversion reactions on compound (5), provide compounds of general structural formula (II) having other recited  $R^1$  through  $R^7$  and  $R^{10}$  substituents.

The following illustrates the synthesis of  
20 various intermediates and compounds of structural formula (II). The following examples are provided for illustration and should not be construed as limiting.

In the structures herein, for a bond  
25 lacking a substituent, the substituent is methyl, for example:

Where no substituent is indicated as attached to a carbon or a nitrogen atom, it is understood that the carbon atom contains the appropriate number of hydrogen atoms.

20

Abbreviations which are well known to one of ordinary skill in the art also are used, e.g., "Me" for methyl, "OMs" for mesylate, "Ph" for phenyl, "CH<sub>2</sub>Cl<sub>2</sub>" for methylene chloride, "NaOH" for sodium hydroxide, "EtOAc" for ethyl acetate, "NH<sub>4</sub>OH" for ammonium hydroxide, "MeOH" for methanol, "LiOH" for lithium hydroxide, "CsCO<sub>3</sub>" for cesium carbonate, "H<sub>2</sub>" for hydrogen gas, "TFA" for trifluoroacetic acid, "OAc" for acetate, "Ac" for acetyl, "t-Bu" for tertiary butyl, "sat." for saturated, "h" for hour, 25 "gm" for gram, "mmol" for millimole, "eq" for equivalent, "M" for molar, and "N" for normal.

**3-Cyclopropylmethoxy-4-methoxybenzaldehyde**

A solution of 3-hydroxy-4-methoxybenzaldehyde (400 g, 2.63 mole) and bromomethylcyclopropane (426 g, 3.2 mole) in 1 L dimethylformamide (DMF) was stirred with potassium carbonate ( $K_2CO_3$ ) (483 g, 3.5 mole) at 55°C for 3.5 h. Then, 1 L of water was added, the mixture chilled on ice, and Intermediate 1 filtered as a white solid, (535 g, 99%).  $m/z$  207 ( $MH^+$ ).

#### 10 Mitsunobu procedure

A solution of 3-hydroxy-4-methoxybenzaldehyde (15.2 g, 100 mmol, 1 eq), 2-indanol (12.1 g, 90 mmol, 0.9 eq), and triphenylphosphine (26.2 g, 100 mmol, 1 eq) in dry THF (300 mL) was treated dropwise with diisopropylazodicarboxylate (DIAC) (19.6 mL, 100 mmol, 1 eq). The reaction mixture was stirred at reflux for 16 h, then cooled and diluted with diethyl ether (500 mL). The solution was washed with water (2 x 150 mL), 1 M NaOH (4 x 125 mL), and saturated sodium chloride (NaCl) (2 x 100 mL), dried with sodium sulfate (Na<sub>2</sub>SO<sub>4</sub>), and concentrated to a syrup that solidified upon standing. The solid was suspended in Et<sub>2</sub>O (350 mL) and stirred overnight to provide small particles. The solid was collected by vacuum filtration and recrystallized from ethanol/water (21.4 g). The ethereal filtrate was concentrated and purified by flash chromatography (silica gel,

### Intermediate 3

#### 3-(tert-Butoxy)-4-methoxybenzaldehyde

To a stirred solution of isovanillin (30.4 gm, 200 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (200 mL) at room temperature under a nitrogen blanket was added (2-aza-1-(tert-butoxy)-3-methylbut-1-enyl)(methylethyl)amine (crude 40 mL, about 200 mmol) as an alkylating agent. Every 2 hours, another molar equivalent of the alkylating agent was added until 5 equivalents total were added. The reaction was allowed to stir another 16 hours. TLC in 3/7 EtOAc/hexane indicated the reaction was approximately 80% to complete. The mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (500 mL) and washed

with 3M NaOH (4 x 300 mL) to remove unreacted isovanillin. The organics were dried over magnesium sulfate ( $\text{MgSO}_4$ ), filtered, and concentrated in vacuo to a crude brown oil, which was flash chromatographed in 3/1 hexane/EtOAc and dried in vacuo to provide pure Intermediate 3 (22.6 gm, 54%).

#### Intermediate 4

(2E)-3-(3-tert-Butoxy-4-methoxyphenyl)-2-methylacrylic acid ethyl ester

#### Horner-Emmons Procedure

To a stirred solution of triethyl 2-phosphonopropionate (25.6 mL, 119.4 mmol) in THF (120 mL) at 0°C under a nitrogen blanket was added lithium hexamethyldisilylamide (1M in THF, 114 mL, 114 mmol) dropwise by syringe. After 30 minutes, a solution of Intermediate 3 (22.6 gm, 108 mmol) in THF (40 mL) was added by cannulation. After 2 hours at 0°C, TLC in 4/1 hexane/EtOAc showed complete reaction. The

reaction was partially concentrated by rotary evaporator and partitioned between EtOAc (500 mL) and water (500 mL). The organics were washed with saturated NaCl (500 mL), dried (MgSO<sub>4</sub>), filtered, and concentrated in vacuo. The crude product was flash chromatographed in 9/1 hexane/EtOAc to provide, after concentration in vacuo, Intermediate 4 (34.1 gm, 98%).

#### Intermediate 5

(2E)-3-(3-tert-Butoxy-4-methoxyphenyl)-2-methylacrylic acid

#### Lithium hydroxide hydrolysis procedure

To a stirred solution of Intermediate 4 (34.1 gm, 116 mmol) in dioxane (116 mL) at room temperature under a nitrogen blanket was added a solution of LiOH monohydrate (5.87 gm, 140 mmol) in water (116 mL). The reaction was heated at 80°C for 2 hours, then allowed to cool to room temperature. The reaction then was partitioned between EtOAc (400 mL) and 1M phosphoric acid (H<sub>3</sub>PO<sub>4</sub>) (400 mL). The

organics were isolated, washed with H<sub>2</sub>O (400 mL) and saturated NaCl (400 mL), dried (MgSO<sub>4</sub>), filtered, and concentrated in vacuo to provide Intermediate 5 as a white solid (28.2 gm, 92%).

(E)-4-(3-Benzyloxy-4-methoxyphenyl)-3-methylbut-3-en-2-one

20     *Acid-catalyzed aldol condensation procedure*

A solution of commercially available 3-benzyloxy-4-methoxybenzaldehyde (34 g, 0.14 mol, 1 eq) and 2-butanone (50 mL, 0.56 mol, 4 eq) in dry THF (50 mL) was cooled to -4°C. Hydrogen chloride gas was passed through the well-stirred solution for several minutes, and the reaction mixture was capped and stored at -4°C for 16 h. The mixture was poured into a well stirred solution of ice-cold saturated sodium bicarbonate (NaHCO<sub>3</sub>) (about 2 L). If necessary, the pH was adjusted to >7 with sat. NaHCO<sub>3</sub>, and the mixture was extracted with EtOAc (3 x 300 mL).

*Acid chloride procedure*

To a cooled (0°C), stirred slurry of Intermediate 11 (55 g, 199 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (400 mL) was added a solution of oxalyl chloride in CH<sub>2</sub>Cl<sub>2</sub> (109 mL of 2.0 M, 218 mmol, 1.1 eq.) via syringe under a calcium chloride-dried atmosphere over 10 minutes. Vigorous bubbling was observed. The resulting dark solution was allowed to stir at 0°C for 15 minutes, then a catalytic amount of DMF was added via syringe (0.3 mL). The resulting solution was stirred at 0°C for 0.5 hours while the bubbling subsided, then allowed to warm to room temperature and stir overnight (17 hours). The reaction was diluted with EtOAc (500 mL) and was carefully quenched with water (250 mL). After vigorously stirring for 1 hour, the layers were separated and the organic layer was washed with water (400 mL) and brine (400 mL), then dried (MgSO<sub>4</sub>), filtered, and concentrated in vacuo to provide Intermediate 12 as a brown solid (57.5 g, 98%).

15 *Oxazolidinone Acylation Procedure*

To a cooled (-78°C), overhead, mechanically stirred solution of R-phenyl oxazolidinone (10.0 g, 61.3 mmol) in dry tetrahydrofuran (400 mL) was added a solution of n-butyllithium in hexanes (27 mL of 2.5 M, 1.1 eq.) via syringe under a nitrogen atmosphere. The resulting solution was allowed to stir at -78°C for 0.8 hours, then a solution of Intermediate 12 (19.9 g, 67.4 mmol, 1.1 eq.) in THF (100 mL) was added via cannula. After stirring at -78°C for 15 minutes, the reaction was allowed to slowly warm to 0°C over 40 minutes during which time the reaction became a thick slurry. After stirring at 0°C for 2.5 hours, the reaction was quenched with saturated, aqueous ammonium chloride (NH<sub>4</sub>Cl) (300 mL) and the bulk of the THF was removed at reduced pressure. The residue then was extracted with chloroform

(CHCl<sub>3</sub>) (3 x 700 mL) and the combined organic layers were washed with water (300 mL) and brine (300 mL), then dried (MgSO<sub>4</sub>), filtered, and concentrated in vacuo to provide about 33 g of a light orange solid.

The material was suspended in 10% EtOAc in hexane (1.2 L) and vigorously stirred overnight. The resulting fine powdery solids were collected on a Buchner funnel with suction, then dried in vacuo to provide Intermediate 16 as a tan powder (21.8 g, 88%).

Intermediate 27

(±)-[1-Benzyl-4-(3-cyclopentyloxy-4-methoxyphenyl)-3-methylpyrrolidin-3-yl]methanol

To a magnetically stirred solution of Intermediate 25 (9.32g, 21.3 mmol) in dry toluene (10 mL) at 0°C was added diisobutylaluminum hydride (64 mL, 1.0M in CH<sub>2</sub>Cl<sub>2</sub>, 63.9 mmol). The mixture was stirred for 30 minutes at 0°C, then at room temperature for 1 hour,

and finally quenched with MeOH (20 mL). A 1.0 N hydrochloric acid (HCl) solution (100 mL) then was added, and the mixture stirred another 30 minutes. The phases were separated and the aqueous phase extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x20 mL). The organic phases were washed with a saturated NH<sub>4</sub>Cl solution, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, then concentrated to afford a light yellow oil product (8.28g, 98% yield).

<sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ: 7.31-7.14 (m, 5H, aromatic), 6.78-6.71 (m, 3H, aromatic), 4.76-4.73 (br. m, 1H), 3.79 (s, 3H, OCH<sub>3</sub>), 3.71-3.55 (m, 3H), 3.47-3.10 (m, 3H), 2.92 (d, 1H, J=9.2 Hz), 2.62 (m, 1H), 3.35-2.33 (m, 2H), 1.89-1.58 (m, 8H, cyclopentyl), 0.52 (s, 3H, CH<sub>3</sub>).

Intermediate 28

(±)-1-Benzyl-4-(3-cyclopentyloxy-4-methoxyphenyl)-3-methylpyrrolidine-3-carboxaldehyde

A solution of oxalyl chloride (4.87 mL, 9.73 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (20 mL) was chilled to -78°C under a nitrogen blanket, and stirred while being treated with a solution of dimethyl sulfoxide (DMSO, 1.38 mL, 19.5 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (5 mL). Gas evolution was observed. When the addition was complete, the solu-

tion was stirred for 5 minutes, then a solution of Intermediate 27 (3.5 g, 8.85 mmol) in  $\text{CH}_2\text{Cl}_2$  (10 mL) was added over a period of 10 minutes. The mixture was stirred for 30 minutes, treated with triethylamine ( $\text{Et}_3\text{N}$ ) (6.7 mL, 44.3 mmol), and allowed to warm to room temperature. Water was added to the mixture, and the resulting phases separated. The aqueous phase was extracted with  $\text{CH}_2\text{Cl}_2$  (2x50mL). The combined organic phases were washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated to give an oily product (3.2g, 92%).

$^1\text{H}$  NMR (300 MHz,  $\text{CDCl}_3$ )  $\delta$ : 9.63 (s, 1H, CHO), 7.34-7.21 (m, 5H, aromatic), 6.78-6.68 (m, 3H, aromatic), 4.73 (br. m, 1H), 3.80 (s, 3H,  $\text{OCH}_3$ ), 3.78-3.61 (m, 3H), 3.18-3.11 (m, 2H), 2.86-2.81 (m, 1H), 2.58-2.52 (m, 1H), 2.43-2.34 (m, 2H), 1.87-1.59 (m, 8H, cyclopentyl), 0.74 (s, 3H,  $\text{CH}_3$ ).

#### Intermediate 29

(±)-1-[1-Benzyl-4-(3-cyclopentyloxy-4-methoxyphenyl)-3-methylpyrrolidin-3-yl]-1-hydroxypropan-2-one

To a solution of ethyl vinyl ether (0.95 mL, 9.91 mmol) in dry THF (4 mL) at  $-78^\circ\text{C}$  was added 1.7M t-butyllithium in pentane (5.25 mL, 8.93 mmol), and the resulting solution was warmed to  $0^\circ\text{C}$ . The color

of the solution changed from yellow to colorless. The resulting vinyl anion then was cooled to  $-78^{\circ}\text{C}$ , and a solution of Intermediate 28 (1.95 g, 4.96 mmol) in THF (10 mL) was added dropwise. The resulting mixture was stirred for 45 minutes, quenched with saturated  $\text{NH}_4\text{Cl}$  (15 mL), and extracted with  $\text{Et}_2\text{O}$  (3x30 mL). The combined organic extracts were dried over  $\text{Na}_2\text{SO}_4$  and concentrated. The crude product was dissolved in  $\text{Et}_2\text{O}$  and treated with concentrated sulfuric acid ( $\text{H}_2\text{SO}_4$ ) in a separatory funnel while shaking vigorously. The  $\text{Et}_2\text{O}$  solution was washed with water (30 mL), with saturated  $\text{NaHCO}_3$  (30 mL) solution, dried over  $\text{Na}_2\text{SO}_4$ , and concentrated. The residue was purified by flash chromatography (silica gel, 20%  $\text{EtOAc}$ -hexanes) to provide Intermediate 29 as an orange oil (1.36 g, 62% yield).

$^1\text{H}$  NMR (300 MHz,  $\text{CDCl}_3$ )  $\delta$ : 7.34-7.27 (m, 5H, aromatic), 6.77-6.68 (m, 3H, aromatic), 4.75-4.72 (br. m, 1H), 4.13-4.08 (m, 1H), 3.81 (s, 3H,  $\text{OCH}_3$ ), 3.79-3.57 (m, 3H), 3.26 (m, 1H), 2.99 (d, 1H,  $J=9.2$  Hz), 2.69-2.64 (m, 1H), 2.39 (d, 1H,  $J=9.2$  Hz), 2.25 (s, 3H,  $\text{OCH}_3$ ), 1.94-1.59 (m, 8H, cyclopentyl), 0.69 (s, 3H,  $\text{CH}_3$ ).

Example 1

(±)-4-(3-Cyclopentyloxy-4-methoxyphenyl)-3-(1-hydroxy-1-methylethyl)-3-methylpyrrolidine-1-carboxylic acid methyl ester

To a 3.0 M solution of methylmagnesium bromide (0.6 mL, 1.8 mmol) in Et<sub>2</sub>O at 0°C was added a solution of Intermediate 36 (0.65 g, 1.73 mmol) in dry THF (5 mL), dropwise via a syringe pump. The resulting mixture was stirred at 0°C for 30 minutes, then at room temperature for 1 hour. The reaction mixture then was quenched with saturated NH<sub>4</sub>Cl (15 mL) and extracted with Et<sub>2</sub>O (2x10 mL). The combined organic extracts were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated. The residue was purified by flash chromatography (silica gel, 20% EtOAc-hexanes, then 50%) to provide Example 1 as an orange oil (0.37 g, 55%).

<sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ: 6.83-6.77 (m, 3H, aromatic), 4.75-4.74 (br. m, 1H), 3.83 (s, 3H, OCH<sub>3</sub>), 3.96-3.50 (m, 4H), 3.73 (s, 3H, OCH<sub>3</sub>), 3.37-3.25 (m, 1H), 1.96-1.59 (m, 8H, cyclopentyl), 1.22 (s, 3H, CH<sub>3</sub>), 1.07 (s, 6H, CH<sub>3</sub>).

Intermediate 30

2-[1-Benzyl-4-(S)-(3-cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-methylpyrrolidin-3-yl]propan-2-ol

Intermediate 33 (0.992 g, 2.52 mmol) was dissolved in THF (7.5 mL) and the solution was cooled to 0°C. Methylmagnesium iodide (3.0 M in ether, 2.52 mL, 7.6 mmol) was added and the reaction mixture was stirred at 0°C for 1.5 hours. Saturated  $\text{NH}_4\text{Cl}$  was added and the reaction mixture was concentrated in *vacuo*. The residue was diluted with EtOAc and the organic layer was washed three times with saturated  $\text{NaHCO}_3$ , saturated  $\text{NaCl}$ , then dried over  $\text{Na}_2\text{SO}_4$  and concentrated in *vacuo* (0.96 g, 93%).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz)  $\delta$ : 7.33-7.24 (m, 5H), 6.83-6.77 (m, 3H), 3.86-3.74 (m, 7H), 3.68-3.59 (dd, 2H), 3.32 (dd, 1H), 3.24 (d, 1H), 2.48 (dd, 1H), 2.16 (d, 1H), 1.35-1.28 (m, 1H), 1.21-1.18 (m, 5H), 0.66-0.60 (m, 2H), 0.56 (s, 3H), 0.38-0.33 (m, 2H).

LRMS (Electrospray, positive):  $\text{Da/e}$  410.5 ( $m+1$ ).

Intermediate 31

2-[4-(S)-(3-Cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-methylpyrrolidin-3-yl]propan-2-ol

Intermediate 30 (0.96 g, 2.3 mmol) was dissolved in methanol (10 mL) and the solution was treated with Pearlman's catalyst (20% Pd(OH)<sub>2</sub> on carbon, 200 mg) and ammonium formate (1.0 g, 15.8 mmol). The solution was heated to reflux for 6 hours. The catalyst was removed by filtration and the solution was concentrated *in vacuo*. The residue was dissolved in EtOAc and washed three times with water, saturated NaCl, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated *in vacuo*, (384 mg, 52%).

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ: (6.83-6.79(m, 3H), 3.86-3.80 (m, 5H), 3.75-3.66 (m, 2H), 3.57-3.51 (m, 2H), 3.22-3.17 (m, 1H), 2.78-2.67 (m, 1H), 1.34-1.21 (m, 7H), 0.69 (s, 3H), 0.66-0.60 (m, 2H), 0.37-0.33 (m, 2H).

LRMS (Electrospray, positive): Da/e 320.3(m+1).

Intermediate 32

2-Benzyloxy-1-[4-(S)-(3-cyclopropylmethoxy-4-methoxyphenyl)-3-(1-hydroxy-1-methylethyl)-3-(S)-methylpyrrolidin-1-yl]ethanone

Intermediate 31 (75 mg, 0.23 mmol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (1 mL) and the solution was treated with N,N-diisopropylethylamine (DIEA) (61  $\mu\text{L}$ , 0.35 mmol), then cooled to  $0^\circ\text{C}$ . Benzyloxyacetyl chloride (55.6  $\mu\text{L}$ , 0.23 mmol) was added, and the solution was stirred at  $0^\circ\text{C}$  for 3 hours. The reaction mixture was diluted with  $\text{CH}_2\text{Cl}_2$  and washed three times with 1N HCl, once with water, three times with 6%  $\text{NaHCO}_3$ , then dried with  $\text{Na}_2\text{SO}_4$  and concentrated *in vacuo*. The crude product (103 mg) was chromatographed with EtOAc/hexane (1:1) to provide Intermediate 32 (21 mg, 19%).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz)  $\delta$ : 7.41-7.27 (m, 5H), 6.85-6.76 (m, 3H), 4.66-4.61 (m, 2H), 4.13-4.07 (m, 2H), 3.94-3.59 (m, 7H), 3.53-3.47 (m, 1H), 3.28-3.22 (m,

LRMS (Electrospray, positive): Da/e 468.3 (m+1).

#### Example 2

1-[4-(S)-(3-Cyclopropylmethoxy-4-methoxyphenyl)-3-(1-hydroxy-1-methylethyl)-3-(S)-methylpyrrolidin-1-yl]-2-hydroxyethanone

Intermediate 32 (21 mg, 45  $\mu$ mol) was dissolved in ethanol (95%, 2 mL) and treated with Pearlman's catalyst (20% Pd(OH)<sub>2</sub> on carbon, 20 mg). The solution was subjected to 1 atmosphere of H<sub>2</sub> for 20 hours. The catalyst was removed by filtration and concentrated *in vacuo*, to afford Example 2 (15 mg, 88%).

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$ : 6.87-6.80 (m, 3H), 4.20-4.09 (m, 2H), 3.89-3.62 (m, 9H), 3.58-3.51 (m, 1H), 3.13-2.87 (m, 2H), 1.35-1.01 (m, 10H), 0.67-0.61 (m, 2H), 0.39-0.33 (2H).

Intermediate 33

**1-[1-Benzyl-4-(S)-(3-cyclopropylmethoxy-4-methoxy-phenyl)-3-(S)-methylpyrrolidin-3-yl]ethanone**

Oxalyl chloride (2.0M in  $\text{CH}_2\text{Cl}_2$ , 1.35 mL, 2.7 mmol) was added to  $\text{CH}_2\text{Cl}_2$  (4 mL) and the solution was cooled to  $-60^\circ\text{C}$ . A solution of DMSO (0.36 mL, 5.0 mmol) in  $\text{CH}_2\text{Cl}_2$  (1.5 mL) was added slowly. This solution was stirred for 5 minutes, then Intermediate 66 (1.06 g, 2.7 mmol) dissolved in  $\text{CH}_2\text{Cl}_2$  (7.5 mL) was added to the solution. The reaction was stirred for 30 minutes at  $-60^\circ\text{C}$ , then quenched with  $\text{Et}_3\text{N}$  (1.9 mL). The mixture was allowed to warm to room temperature, diluted with water, and after stirring vigorously for several minutes, the layers were separated. The organic layer was washed three times with 1 N HCl, three times with 6%  $\text{NaHCO}_3$ , then dried over  $\text{Na}_2\text{SO}_4$ , and concentrated *in vacuo*. Inter-

mediate 33 was recovered and used without purification, (0.992 g, 93%).

LRMS (Electrospray, positive): Da/e 392.4 (m+1).

(4R)-3-{[(3S,4S)-4-(3-Cyclopentyloxy-4-methoxy-phenyl)-3-methyl-1-benzylpyrrolidin-3-yl]carbonyl}-4-phenyl-1,3-oxazolidin-2-one

To a cooled (-4°C), stirred slurry of acyl oxazolidinone (9.30 g, 22.8 mmol) and N-(methoxymethyl)-N-(trimethylsilylmethyl)benzylamine (11.7 mL, 45.6 mmol, 2 eq.) in CHCl<sub>3</sub> (65 mL) was added a solution of TFA in CHCl<sub>3</sub> (4.6 mL of 1.0 M, 4.6 mmol, 0.2 eq.) via syringe under a nitrogen atmosphere. The resulting slurry was stirred at about 0°C for 4 hours, then at about 15°C overnight (water bath). The resulting cloudy solution then was recooled to -4°C, treated with an additional portion of N-(methoxymethyl)-N-(trimethylsilylmethyl)benzylamine (5.9 mL, 22.8 mmol, 1 eq.) via syringe, and allowed to stir for 5 hours more during which time the reaction became homogenous. TLC (5% Et<sub>2</sub>O in CH<sub>2</sub>Cl<sub>2</sub>) showed the reaction was complete. The bulk of the CHCl<sub>3</sub> was removed at reduced pressure, and the residue was diluted with EtOAc (250 mL) and washed successively

with 1 N aqueous HCl (2 x 50 mL), 1 N aqueous NaOH (50 mL) and brine (50 mL). The organic layer then was dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo to give an orange semi-solid (13.9 g). Purification via flash chromatography on silica gel (2% ether in CH<sub>2</sub>Cl<sub>2</sub>) provided the major diastereomer as a white foam (8.25 g, 65%).

Diastereomeric selectivity about 10:1 (HPLC).

**(3S,4S)-1-Benzyl-4-(3-cyclopentyloxy-4-methoxyphenyl)-3-methylpyrrolidine-3-carboxylic acid**

A suspension of lithium peroxide (0.5 g, 10.8 mmol) in water-THF (1:1, 6 mL) was added to a solution of

Intermediate 42 (3.0 g, 5.4 mmol) in water-THF (3:1, 30 mL) at 0°C under a nitrogen blanket. The suspension solubilized immediately. After 1 hour of stirring at 0°C, an aqueous sodium sulfite ( $\text{Na}_2\text{SO}_3$ ) solution (1.5 N, 12 mL) was added to quench excess peroxide, and THF was removed under reduced pressure.

The basic residue was extracted with three 30 mL portions of  $\text{CH}_2\text{Cl}_2$ . The aqueous phase was acidified to pH 1 with aqueous 1.0 N HCl solution, and extracted with three 30 mL portions of  $\text{Et}_2\text{O}$ . The ether extracts were dried ( $\text{Na}_2\text{SO}_4$ ), concentrated under reduced pressure and used without further purification.

A solution of Intermediate 44 (0.17 g, 0.43 mmol) in THF (8 mL) was cooled to  $-78^{\circ}\text{C}$  and treated with methyl lithium (1.5 M in THF, 0.315 mL, 0.47 mmol) under a nitrogen blanket. The solution was stirred for 40 minutes at  $-78^{\circ}\text{C}$ , then quenched with a cold saturated aqueous  $\text{NH}_4\text{Cl}$  solution (8 mL). A mixture of hexanes/ $\text{CH}_2\text{Cl}_2$  (3:1, 8 mL) was added with vigorous stirring. After a further dilution with more hexanes/ $\text{CH}_2\text{Cl}_2$  (3:1, 10 mL), brine (10 mL) was added and the two layers separated. The aqueous layer was washed with  $\text{CH}_2\text{Cl}_2$  (8 mL) and the combined organic extracts washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated under reduced pressure into an oil product (154 mg, 89%).

*General Oxazolidinone Reduction/Oxidation Procedure*

To a cooled (-78°C), stirred solution of Intermediate 42 (15.09 g, 27.2 mmol) in toluene (250mL) was added a solution of lithium aluminum hydride in tetrahydrofuran (16.3 mL of 1.0 M, 16.3 mmol, 0.6 eq.) via syringe under a nitrogen atmosphere.

Vigorous bubbling was observed. The resulting solution was allowed to stir at -78°C for 2 hours, after which time the cooling bath was removed. The reaction was quenched with the successive addition of water (0.62 mL), 15% aqueous NaOH (0.62 mL), and water (1.9 mL). The resulting mixture was allowed to warm to room temperature, stirred for 30 minutes, then diluted with Et<sub>2</sub>O (500 mL) and dried (MgSO<sub>4</sub>). Filtration and concentration *in vacuo* provided the alcohol (with some aldehyde present) as a semi-solid

(14.8 g). This material was used immediately without further purification.

To a cooled (-78°C), stirred solution of oxalyl chloride in CH<sub>2</sub>Cl<sub>2</sub> (10.9 mL of 2.0 M, 21.8 mmol, 0.8 eq.) in more CH<sub>2</sub>Cl<sub>2</sub> (75 mL) was added DMSO (3.1 mL, 43.5 mmol, 1.6 eq.) via syringe under nitrogen atmosphere. After stirring at -78°C for 20 minutes, a solution of the crude alcohol in CH<sub>2</sub>Cl<sub>2</sub> (75 mL) was added by cannula. The resulting yellow solution was allowed to stir at -78°C for 20 minutes, then Et<sub>3</sub>N (15.2 mL, 109 mmol, 4 eq.) was added by syringe. The reaction was allowed to stir at -78°C for 20 minutes, then warmed to room temperature and stirred for an additional 1 hour. The reaction was quenched with the addition of brine (150 mL), then extracted with CH<sub>2</sub>Cl<sub>2</sub> (2 x 100 mL). Combined organic layers were dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo to provide the crude aldehyde. Purification by flash silica gel chromatography (25% EtOAc in hexanes) provided the aldehyde as a clear, colorless oil (9.8 g, 92%).

To a stirred solution of Intermediate 22 (39.8 gm, 97 mmol) in  $\text{CHCl}_3$  (292 mL) at  $0^\circ\text{C}$  under a nitrogen blanket was added N-(methoxymethyl)-N-(trimethylsilylmethyl)benzylamine (49.5 mL, 194 mmol) followed by TFA acid (1M in  $\text{CHCl}_3$ , 9.7 mL, 9.7 mmol). The slurry was allowed to warm to room temperature overnight. TLC in 2/3 EtOAc/hexane indicated partial conversion of starting material to a slightly higher  $R_f$  product. The resultant solution was treated with more N-(methoxymethyl)-N-(trimethylsilylmethyl)benzylamine (25 mL, 97 mmol) to consume residual starting material. After 3 hours at room temperature, the reaction appeared complete by TLC. The solution was concentrated by rotary evaporator, then redissolved in EtOAc (500 mL). The organics were washed with 2N HCl (2 x 500 mL), 1N NaOH (2 x 500 mL), and saturated NaCl (1 x 500 mL). The organics were dried ( $\text{MgSO}_4$ ), filtered, and concentrated in

**(3R)-4-[3-(tert-Butoxy)-4-methoxyphenyl]-3-methyl-1-benzylpyrrolidine-3-carbaldehyde**

To a stirred solution of Intermediate 54 (21.5 gm, 39.7 mmol) in toluene (400 mL) at -78°C under a nitrogen blanket was added lithium aluminum hydride (1M in THF, 24 mL, 24 mmol) dropwise by syringe over 10 minutes. After 15 minutes, TLC in 4/1 CH<sub>2</sub>Cl<sub>2</sub>/Et<sub>2</sub>O showed complete consumption of starting material and appearance of a lower R<sub>f</sub> material. Methanol (4 mL) in toluene (40 mL) was added carefully by syringe at -78°C with gas evolution. When gas evolution

ceased, the reaction was allowed to warm to room temperature, then treated with water (1 mL), 3N NaOH (2 mL), and water (1 mL) sequentially. After 10 minutes, the reaction was diluted with Et<sub>2</sub>O (300 mL) and stirred for 15 minutes. Magnesium sulfate was added and the mixture filtered through GF/F filter paper with Et<sub>2</sub>O. The crude product was concentrated *in vacuo* and appeared by <sup>1</sup>H-NMR to be an approximately 4:1 mixture of desired aldehyde over reduced alcohol. The crude product was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (40 mL). Separately, oxalyl chloride (2M in CH<sub>2</sub>Cl<sub>2</sub>, 11.2 mL, 22.4 mmol) was stirred at -60°C under a nitrogen blanket and treated with DMSO (3.1 mL, 44 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (15 mL) dropwise by syringe. After 5 minutes, the aldehyde/alcohol mixture solution was added to the oxalyl chloride/DMSO solution by cannula. The reaction was stirred at -60°C for 45 minutes, then treated with Et<sub>3</sub>N (13.8 mL, 100 mmol) and allowed to warm to room temperature. The solution was diluted to 200 mL with CH<sub>2</sub>Cl<sub>2</sub> and washed with water (1 x 200 mL), 2N HCl (2 x 200 mL), saturated NaHCO<sub>3</sub> (2 x 200 mL), and saturated NaCl (1 x 200 mL). The organic layers were dried (MgSO<sub>4</sub>), filtered, and concentrated *in vacuo* to a yellow oil which was dissolved in 3/1 hexane/EtOAc. After dissolution, the cleaved phenyl oxazolidinone precipitated and was removed by filtration. To a cooled (0°C), stirred solution of Intermediate 47 (0.96 mg, 2.45 mmol) in dry Et<sub>2</sub>O (10mL) was added a solution of methylmagnesium iodide (or other Grignard reagent) in ether (2.45 mL of 3.0 M, 7.35 mmol, 3 eq.) via syringe under a nitrogen atmosphere. After stirring at 0°C for 15 minutes, the reaction was allowed to warm to room temperature and stirred for 2 hours. The reaction then was carefully quenched with saturated aqueous NH<sub>4</sub>Cl (40 mL), and extracted with EtOAc (3 x 50 mL). Combined or-

ganic layers were washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated in vacuo to give 990 mg of an orange oil. Purification via flash silica gel chromatography ( $\text{CH}_2\text{Cl}_2$  to 5% methanol in  $\text{CH}_2\text{Cl}_2$ ) afforded the less polar diastereomer (419 mg, 42%) and the more polar diastereomer (375 mg, 37%) as colorless, viscous oils.

To a stirred solution of trimethylaluminum (2M in toluene, 59.4 mL, 119 mmol) at 0°C under a nitrogen blanket was added methylmagnesium iodide (3M in Et<sub>2</sub>O, 36 mL, 108 mmol). After 30 minutes at 0°C, the organometallic solution was added via cannulation to a solution of Intermediate 55 (13.7 gm, 36 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (360 mL) at -78°C under a nitrogen blanket. After complete addition, the reaction was stirred at -78°C for 6 hours. The reaction then was warmed to 0°C and carefully poured into ice cold 1M potassium sodium tartrate (1500 mL) with rapid stirring, and diluted with EtOAc (1500 mL). After stirring for 15 minutes, the layers were separated and the organics washed with 1M potassium sodium tartrate (1 x 1000 mL) and saturated NaCl (1 x 1000 mL). The organics were dried (MgSO<sub>4</sub>), filtered, and concentrated in vacuo to provide a 2.5:1 mixture of diastereomers plus approximately 10% residual starting aldehyde by

crude  $^1\text{H}$ -NMR. The crude product was chromatographed on a 110 mm x 8" column with 3/7/0.4 EtOAc/hexane/-MeOH to provide, after pooling and concentration in vacuo of the desired lower  $R_f$  diastereomer containing fractions, Intermediate 59 (8.1 gm, 57%) as an orange oil.

**3-(3-Cyclopropylmethoxy-4-methoxyphenyl)-2-methyl-E-acrylic acid ethyl ester**

A round-bottomed flash was charged with THF (850 mL) and triethyl 2-phosphonopropionate (97.2 g, 0.408 mol) and the resulting mixture was cooled to 0°C. Lithium hexamethyldisilazide (1.0 M in THF, 489 mL, 0.489 mol) then was added dropwise. The mixture was stirred for 30 minutes at 0°C, then a solution of Intermediate 1 (70 g, 0.34 mol) in THF (100 mL) was added. After the dropwise addition, the reaction mixture was maintained at 22°C for 62 hours. The

reaction was quenched with saturated NaCl and diluted with EtOAc. After separation, the organic layer was washed with saturated NaCl, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. The green oil was purified by chromatography through a pad of SiO<sub>2</sub> (650 g) using EtOAc/hexanes (1:10) as eluant, (40.8 g).

Intermediate 61

**3-(3-Cyclopropylmethoxy-4-methoxy-phenyl)-2-methyl-E-acrylic acid**

Intermediate 60 (26.9 g, 93 mmol) was dissolved in 1,4-dioxane (95 mL) and treated with a solution of LiOH monohydrate (4.6 g, 111 mmol) dissolved in water (95 mL). The resulting solution was heated at 80°C for 3 hours, then stirred overnight at room temperature. The reaction mixture was poured into water (350 mL) and extracted twice with Et<sub>2</sub>O (500 mL total). The aqueous layer was diluted with EtOAc

(350 mL) and the pH was adjusted with concentrated  $\text{H}_3\text{PO}_4$  (24 mL). The layers were separated, the EtOAc layer was washed with water and saturated NaCl, dried over  $\text{MgSO}_4$ , and concentrated *in vacuo* (20.4 g).

Intermediate 62

**3-(3-Cyclopropylmethoxy-4-methoxyphenyl)-2-methyl-E-acryloyl chloride**

Intermediate 61 (55.8 g, 0.213 mol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (300 mL) and cooled to  $0^\circ\text{C}$  with a drying tube attached. Oxalyl chloride (2.0 M in  $\text{CH}_2\text{Cl}_2$ , 117 mL, 0.234 mol) was added followed by addition of DMF (1.0 mL). The reaction mixture was maintained at  $22^\circ\text{C}$  for several hours. The mixture was diluted with  $\text{CH}_2\text{Cl}_2$  and washed with water, saturated NaCl, then dried over  $\text{Na}_2\text{SO}_4$ , and concentrated *in vacuo* (65.1 g yellow solid).

Intermediate 63

3-[3-(3-Cyclopropylmethoxy-4-methoxyphenyl)-2-methyl-E-acryloyl]-4-(R)-phenyloxazolidin-2-one

4-(R)-Phenyloxazolidin-2-one (33.0 g, 0.202 mol) was dissolved in THF (1 L) and cooled to  $-78^{\circ}\text{C}$ . n-Butyl lithium (2.5 M in hexanes, 79.5 mL, 0.198 mol) was added, and the resulting reaction mixture was stirred for 20 minutes. A solution of Intermediate 62 (65.1 g, 0.213 mol) in THF (200 mL) was added dropwise over 15 minutes. The reaction mixture was stirred for 1 hour at  $-78^{\circ}\text{C}$ , then warmed to  $0^{\circ}\text{C}$ , slowly. The reaction mixture became thick with beige solids. The mixture was neutralized at  $0^{\circ}\text{C}$  with saturated  $\text{NH}_4\text{Cl}$  (600 mL) and water (300 mL). The solution was warmed to  $22^{\circ}\text{C}$  quickly and poured into  $\text{CHCl}_3$  (2400 mL). After shaking and separation, the organic layer was washed with water (1 L), saturated  $\text{NaCl}$  (1 L), dried over  $\text{Na}_2\text{SO}_4$ , and concentrated *in vacuo* to a pale orange solid (94.4 g).

Intermediate 64

**3-[1-Benzyl-4-(S)-(3-cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-methylpyrrolidine-3-carbonyl]-4-(R)-phenyloxazolidin-2-one**

Intermediate 63 (94.4 g, 0.21 mol) was dissolved in CHCl<sub>3</sub> (640 mL), then cooled to 0°C. Benzyl methoxymethyltrimethylsilanylmethylamine (95 g, 0.40 mol) was added, and the reaction mixture was treated dropwise with a solution of TFA (3.08 mL) in CHCl<sub>3</sub> (40 mL). The reaction was stirred overnight while warming to 22°C. Additional benzyl methoxymethyltrimethylsilanylmethylamine (71.2 g, 0.3 mol) was added, then the mixture was stirred for an additional 68 hours. The reaction was quenched with saturated NH<sub>4</sub>Cl (600 mL) and separated. The organic

layer was washed twice with 1 N HCl (500 mL), once with water, once with 1 N NaOH (500 mL), once with water, once with 6% NaHCO<sub>3</sub>, once with saturated NaCl, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. The crude material was chromatographed on SiO<sub>2</sub> (1.2 kg) in two portions using hexanes/EtOAc (2:1) as eluant (62.3 g).

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ: 7.44-7.20 (m, 10H), 7.07 (d, 1H), 6.94-6.91 (dd, 1H), 6.78-6.76 (d, 1H), 5.56-5.50 (dd, 1H), 4.69-4.63 (dd, 1H), 4.21-4.16 (dd, 1H), 3.83-3.80 (m, 2H), 3.82 (s, 3H), 3.74-3.70 (d, 1H), 3.64-3.59 (d, 1H), 3.50-3.46 (d, 1H), 2.90-2.86 (d, 1H), 2.83-2.71 (m, 2H), 1.36-1.29 (m, 1H), 0.64-0.60 (m, 2H), 0.38-0.32 (m, 2H).

Intermediate 65

**1-Benzyl-4-(S)-(3-cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-methylpyrrolidine-3-carbaldehyde**

Intermediate 64 (62.3 g, 0.115 mol) was dissolved in toluene (1 L), then cooled to -78°C. The solution was treated with lithium aluminum hydride (1.0 M in THF, 69 mL, 69 mmol) by slow addition. The reaction

was stirred for 0.5 hours, then quenched at  $-78^{\circ}\text{C}$  with a dropwise addition of MeOH (13 mL). The reaction was stirred for 5 minutes at  $-78^{\circ}\text{C}$ , warmed to  $0^{\circ}\text{C}$ , followed by an addition of water (2.62 mL), 15% NaOH (2.62 mL), and water (7.85 mL). The solution was stirred for 10 minutes, then  $\text{Et}_2\text{O}$  was added (1.5 L) and the resulting mixture was stirred overnight at  $22^{\circ}\text{C}$ . Magnesium sulfate was added and after stirring for 15 minutes, the solution was filtered through  $\text{MgSO}_4$  and concentrated *in vacuo*. NMR showed that the products of this reaction were a mixture of the desired aldehyde and the primary alcohol (about 4:1). This material was used without further purification in the following Swern oxidation below.

Oxalyl chloride (2.0 M in  $\text{CH}_2\text{Cl}_2$ , 25 mL, 50 mmol) was added to  $\text{CH}_2\text{Cl}_2$  (75 mL) and cooled to  $-60^{\circ}\text{C}$ . Dimethylsulfoxide (7.1 mL, 100 mmol) was added as a solution in  $\text{CH}_2\text{Cl}_2$  (30 mL) in a dropwise manner. After 5 minutes, a solution of aldehyde/alcohol mixture (4:1,  $\sim 0.115$  mol, (ca. 0.05 mol alcohol)) dissolved in  $\text{CH}_2\text{Cl}_2$  was added dropwise. The mixture was stirred for 30 minutes, then  $\text{Et}_3\text{N}$  (31 mL, 222 mmol) was added, and the solution was warmed to  $22^{\circ}\text{C}$  and stirred overnight. The reaction was quenched with water and stirred vigorously for 20 minutes, then separated. The aqueous layer was washed with  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were washed with saturated NaCl, dried over  $\text{Na}_2\text{SO}_4$ , and concentrated *in vacuo*. Intermediate 65 was purified by filter chromatography using hexanes/ $\text{EtOAc}$  (4:1) as eluant (42 g).

1-[1-Benzyl-4-(S)-(3-cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-methylpyrrolidin-3-yl]ethanol

Trimethylaluminum (2.0 M in toluene, 2.1 mL, 4.2 mmol) was cooled to 0°C and methylmagnesium iodide (3.0 M in ethyl ether, 1.3 mL, 3.95 mmol) was added dropwise. This grey suspension was stirred at 0°C for 30 minutes then it was added through a cannula to a solution of Intermediate 65 (0.5 g, 1.3 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (6.6 mL), which was cooled to -78°C. The reaction mixture was stirred at -78°C for 6 hours. The mixture then was poured directly into a separatory funnel containing Rochelle's salt

(1 M, 150 mL). The residue was rinsed into the funnel with EtOAc. The mixture was diluted with EtOAc and separated. The organic layer was washed a second time with Rochelle's salt, followed by saturated NaCl, dried over MgSO<sub>4</sub>, and concentrated in vacuo. The crude product was a mixture (1:1) of the two diastereomeric alcohols plus a small amount of aldehyde. These materials were separable by chromatography on SiO<sub>2</sub> with EtOAc/hexanes (1:1).

To a stirred solution of Intermediate 71 (2.3 gm, 5.8 mmol) in  $\text{CH}_2\text{Cl}_2$  (18 mL) at  $0^\circ\text{C}$  under a drying tube was added trifluoroacetic acid (2.7 mL, 35 mmol). The cooling bath was removed and the reaction allowed to warm to room temperature, then stirred for 3.5 hours. The reaction was concentrated by rotary evaporator to remove excess trifluoroacetic acid, redissolved in  $\text{CH}_2\text{Cl}_2$  (50 mL), then washed with 10%  $\text{Na}_2\text{CO}_3$  (2 x 50 mL) and saturated  $\text{NaCl}$  (1 x 50 mL). The organic layers were dried ( $\text{MgSO}_4$ ), filtered, and concentrated in vacuo to provide Intermediate 72 as a white foam (1.9 gm, 96%).

*Hunig's Base Mediated Acylation Procedure*

To a cooled (0°C), stirred solution of Intermediate 70 (670 mg, 2.67 mmol) and Hunig's base (1.4 mL, 8.0 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> (10 mL), 1,4-dioxane (5 mL), and MeOH (1 mL) was added methyl chloroformate (0.41 mL, 5.3 mmol) via syringe under a nitrogen atmosphere.

The resulting solution was allowed to stir at 0°C for 1 hour, then diluted with CH<sub>2</sub>Cl<sub>2</sub> (90 mL), washed successively with 1 N aqueous HCl (2 x 20 mL) and brine (20 mL), and dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The residue (737 mg) was dissolved in THF (3 mL) and water (2 mL), then treated with a solution of LiOH (112 mg, 2.67 mmol in 2 mL water) at room temperature. After stirring for 4 hours, the reaction was diluted with EtOAc (100 mL) and washed successively with 1 N aqueous

HCl (2 x 50 mL), saturated aqueous NaHCO<sub>3</sub> (30 mL), and brine (30 mL), then dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated in vacuo. The residue was purified via radial chromatography (4 mm plate with 3% MeOH in CH<sub>2</sub>Cl<sub>2</sub>) to provide Intermediate 74 as a light tan foam (250 mg, 30%).

To a cooled (0°C) solution of Intermediate 76 (200 mg, 1.51 mmol) and Hunig's base (657 mL, 3.78 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (6 mL) was added acetyl chloride (215 µL, 3.03 mmol) by syringe. The resulting mixture was allowed to slowly warm to room temperature over a 16 hour period. The reaction mixture then was washed with 1N HCl (2 x 20 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated to an orange brown oil, which by NMR was shown to be the bis-acylated material. To this material was added 5 mL of 4:1 THF:water, and the mixture stirred for 16 hours at room temperature, extracted with EtOAc, dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated to 186 mg (71%) of an orange oil. NMR and mass spectrometry confirmed the acetoxy acid. To this material in 5 mL of CH<sub>2</sub>Cl<sub>2</sub> was added oxalyl chloride (1.07 mL, 2.14 mmol, 2M solution in CH<sub>2</sub>Cl<sub>2</sub>) and a drop of DMF. The mixture was stirred at room temperature for 4 hours, then concentrated under reduced pressure to afford Intermediate 77.

#### Chiral Separation of the alcohols

Two columns were required to separate the four diastereomers by HPLC. The first dextrose-based column (8 x 30 cm) was used to separate the R,R,S isomer from the others. Ten mL (7.1 mg/mL stock solution) of crude mixture in column buffer was introduced then eluted at 1 mL/min with isocratic hexanes (85%) and isopropanol (15%), collecting the appropriate fractions. The remaining diastereomers were purified on a different dextrose-based column (10 x 50 cm). Again, 10 mL (7.1 mg/mL stock solution) was injected, then eluted at 1mL/min with isocratic hexanes (95%) and isopropanol (5%). The

appropriate fractions were collected, combined and dried to oils.

1-[3-((1R)-1-Hydroxyethyl)(3S,4S)-4-(3-cyclopentyl-oxy-4-methoxyphenyl)-3-methylpyrrolidinyl]-2-(phenylmethoxy)ethan-1-one

*N*-Acylation Procedure

To a stirred solution Intermediate 68 (42.6 mg, 0.13 mmol) in 1,4-dioxane (0.4 mL) was added, successively, aqueous K<sub>2</sub>CO<sub>3</sub> (0.8 mL of 0.65 M, 4 eq.) and a solution of the acid chloride (R<sub>3</sub>-Cl) (21 µL, 0.13 mmol) in 1,4-dioxane (0.4 mL) at room temperature. The resulting solution was allowed to stir at room temperature for 4 hours. The reaction was diluted with EtOAc (30 mL), then washed successively with water (20 mL) and brine (20 mL), dried (MgSO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide Example 7 as a slightly tan foam (46.5 mg, 99%).

1-[3-((1R)-1-Hydroxyethyl)(3S,4S)-4-(3-cyclopentyl-oxy-4-methoxyphenyl)-3-methylpyrrolidinyl]-2-(phenylmethoxy)ethan-1-one

Prepared from Intermediate 68 (176 mg, 0.574 mmol) by the Hunig's base procedure of Intermediate 74 using benzyloxyacetyl chloride (31  $\mu$ L, 0.22 mmol, 2 eq), yielding a clear, colorless oil (79 mg, 29%).

$^1H$  NMR (400 MHz,  $CDCl_3$ , mixture of rotomers)  $\delta$ : 7.38-7.28 (m, 5H), 6.77-6.73 (m, 3H), 4.73-4.71 (m, 1H), 4.65-4.64 (m, 2H), 4.14-3.19 (c, 12H), 2.07-1.56 (m, 8H), 1.16-1.09 (dd, 3H), 0.72 (s, 3H).

Example 65

$R^1 = C_5H_9$ ;  $R^3 = COCH_2OH$

1-[3-((1R)-1-Hydroxyethyl)(3S,4S)-4-(3-cyclopentyl-oxy-4-methoxyphenyl)-3-methylpyrrolidinyl]-2-hydroxyethan-1-one

Prepared from Example 64 by the debenzylation procedure of Intermediate 31 yielding a white solid (47 mg, 73%).

$^1H$  NMR (400 MHz,  $CDCl_3$ , mixture of rotomers)  $\delta$ :

6.82-6.76 (m, 3H), 4.75-4.73 (m, 1H), 4.15-3.04 (c, 12H), 1.92-1.61 (m, 9H), 1.27-1.24 (dd, 3H), 0.76 (s, 3H).

LRMS (Electrospray, positive): Da/e 378.2 (m+1).

Example 66

$R^1 = C_5H_9$ ;  $R^3 = (S) - COCH(OAc)CH_3$

2-[3-((1R)-1-Hydroxyethyl)(3S,4S)-4-(3-cyclopentyl-oxy-4-methoxyphenyl)-3-methylpyrrolidinyl](1S)-1-methyl-2-oxoethyl acetate

Prepared from Intermediate 68 (106 mg, 0.330 mmol) by the acylation procedure of Example 7 using (S)-(-)-2-acetoxypionyl chloride (84  $\mu$ L, 0.66 mmol, 2 eq), yielding a clear, colorless oil that was not purified further.

(2R)-1-((3S,4S)-3-((1R)-1-Hydroxyethyl)-4-[3-(cyclopropylmethoxy)-4-methoxyphenyl]-3-methylpyrrolidinyl)-2-amino-3,3-dimethylbutan-1-one

To a stirred solution of Example 104 (62 mg, 0.12 mmol) in  $\text{CH}_2\text{Cl}_2$  (1.5 mL) at room temperature in a capped flask was added trifluoroacetic acid (77  $\mu\text{L}$ , 1 mmol). After stirring overnight, the reaction was concentrated in vacuo to provide a crude product that appeared to contain trifluoroacetate ester impurity. The crude product was dissolved in 3:2 THF: $\text{H}_2\text{O}$  (1.5 mL) at room temperature, and stirred in a capped flask and treated with LiOH monohydrate (42 mg, 1 mmol). After 1 hour, the mixture was partitioned between EtOAc (15 mL) and water (15 mL). The organic layers were isolated, dried ( $\text{MgSO}_4$ ), filtered, and concentrated in vacuo to provide Example 105 as a white foam (35 mg, 70%).

To a stirred solution of N-Boc-O-benzyl-D-serine (2.95 gm, 10 mmol) in THF (50 mL) at -78°C under a nitrogen blanket was added N-methyl morpholine (3.3 mL, 30 mmol) followed by isobutyl chloroformate (1.3 mL, 10 mmol). After stirring for 30 minutes, a solution/suspension of Intermediate 70 (2.51 gm, 10 mmol) in THF (50 mL) was added by cannula. The

reaction was stirred for 2 hours at  $-78^{\circ}\text{C}$ , then warmed to  $0^{\circ}\text{C}$  for 2 hours. The reaction then was partially concentrated by rotary evaporator to approximately 25 mL, and partitioned between EtOAc (250 mL) and 2N HCl (250 mL). The organic layers were washed with 2N HCl (2 x 250 mL), saturated  $\text{NaHCO}_3$  (3 x 250 mL), and saturated NaCl (1 x 250 mL). The organic layers were dried ( $\text{MgSO}_4$ ), filtered, and concentrated in vacuo to provide Example 106 as a yellow oil (4.2 gm, 79%).

To a stirred solution of Example 106 (4.2 gm, 7.9 mmol) in DMF (24 mL) at room temperature under a nitrogen blanket was added powdered  $\text{K}_2\text{CO}_3$  (5.45 gm, 39.5 mmol) followed by bromomethylcyclopropane (1.53 mL, 15.8 mmol). The suspension was warmed to 65°C for 4 hours, then treated with more bromomethylcyclopropane (1.53 mL, 15.8 mmol). The reaction was stirred another 16 hours at 65°C, then cooled to room temperature and partitioned between EtOAc (500 mL) and water (500 mL). The organic layers were washed with water (3 x 500 mL) and saturated NaCl (1 x 500 mL), dried ( $\text{MgSO}_4$ ), filtered, and concentrated in vacuo. The crude product was divided into two batches, and chromatographed on a Biotage 40M column.

*Solid Phase Mitsunobu Procedure*

To a stirred solution of Example 143 (40 mg, 0.1 mmol) in THF (1.5 mL) at room temperature in a capped conical reaction vial was added PS-triphenylphosphine (1.65 mmol/g, 182 mg, 0.3 mmol). After allowing the suspension to slowly stir for 5 minutes to permit gel swelling, 1-methylcyclopropaneMethanol (29  $\mu\text{L}$ , 0.3 mmol) was added, and the reaction cooled to 0°C. The suspension then was treated with DIAC (59  $\mu\text{L}$ , 0.3 mmol), and the reaction warmed to 65°C.

After stirring slowly overnight, the reaction was cooled to room temperature and filtered through a polystyrene frit with THF (30 mL). The filtrate was concentrated *in vacuo* and flash chromatographed on a 15 mm x 6" column with 1/1/0.1 EtOAc/hexane/Methanol and product containing fractions pooled and concentrated *in vacuo* to provide Example 144 as a yellow oil (40 mg, 86%).

1-[4-(S)-[3-(Bicyclo[4.1.0]hept-7-ylmethoxy)-4-methoxyphenyl]-3-(S)-(1-(R)-hydroxyethyl)-3-methylpyrrolidin-1-yl]-2-hydroxyethanone

Example 150 (15 mg, 30 mmol) was dissolved in 95% ethanol (1 mL) and the solution was treated with Pearlman's catalyst (20% Pd(OH)<sub>2</sub> on carbon, 15 mg). The reaction mixture was hydrogenolyzed at 1 atmosphere (or at 50 psi) of hydrogen for 16 hours. The reaction mixture was filtered to remove the catalyst, then the solvent was removed with a stream of nitrogen. The product was purified by chromatography on silica gel if necessary using EtOAc/hexanes/Methanol (1:1:0.2). (76% yield).

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz) δ: 6.73-6.66(m,3H), 4.04-3.99 (m,2H), 3.94-3.87 (m, 4H), 3.83-3.20 (m, 7H), 3.15-2.73 (m, 1H), 1.78-1.47 (m, 5H), 1.14-0.69 (10H), 0.63-0.60 (3H).

2-[3-((1R)-1-Hydroxyethyl)(3S,4S)-4-(3-hydroxy-4-methoxyphenyl)-3-methylpyrrolidinyl]-2-oxoethyl acetate

Example 172 was deprotected by the TFA method of Example 143 to afford Example 173 as a tan foam (173 mg, 80%).

$^1H$  NMR (400 MHz,  $CDCl_3$ , mixture of rotomers)  $\delta$ : 6.86-6.70 (m, 3H), 5.64 (br s, 1H), 4.72-4.62 (m, 2H), 3.88 (m, 3H), 3.95-3.18 (c, 6H), 2.20 (d, 3H), 1.15 (t, 3H), 0.77 (d, 3H).

LRMS (Electrospray, positive): Da/e 352.2 (m+1).

Example 174

$R^1 = 4\text{-Ph-Ph-CH}_2\text{CH}_2$ ;  $R^3 = \text{C}(=\text{O})\text{CH}_2\text{OCH}_2\text{Ph}$

2-Benzyloxy-1-[(3S,4S)-4-[3-(2-biphenyl-4-ylethoxy)-4-methoxyphenyl]-3-((R)-1-hydroxyethyl)-3-methylpyrrolidin-1-yl]ethanone

Example 143 (60 mg, 0.15 mmol) was subjected to the Mitsunobu procedure of Example 144 using 4-hydroxyethylbiphenyl (90 mg, 0.45 mmol) and used without further purification or characterization (73 mg, 84%).

Example 175

$R^1=4\text{-Ph-Ph-CH}_2\text{CH}_2$ ;  $R^3=\text{C}(=\text{O})\text{CH}_2\text{OH}$

1-[(3S,4S)-4-[3-(2-Biphenyl-4-ylethoxy)-4-methoxy-phenyl]-3-((R)-1-hydroxyethyl)-3-methylpyrrolidin-1-yl]-2-hydroxyethanone

Example 174 was subjected to the debenzylation procedure of Intermediate 31 to afford Example 175.

$^1\text{H NMR}$  (300 MHz,  $\text{CDCl}_3$ , mixture of rotomers)  $\delta$ :

Example 176

$R^1 = \text{CH}_2\text{C}\equiv\text{CPh}$ ;  $R^3 = \text{COCH}_2\text{OAc}$

2-{3-((1R)-1-Hydroxyethyl)(3S,4S)-4-[4-methoxy-3-(3-phenylprop-2-ynyloxy)phenyl]-3-methylpyrrolidinyl}-2-oxoethyl acetate

A round bottom flask equipped with a stir bar and condenser was charged with the compound of Example 173 (270 mg, 0.769 mmol), acetone (5 mL),  $\text{CsCO}_3$  (376 mg, 1.15 mmol), and Intermediate 90 (242 mg, 1.15 mmol) under a nitrogen atmosphere. The mixture was refluxed for 4 hours, then allowed to cool to room temperature. The acetone was removed under reduced pressure, and the residue taken up in EtOAc/water. The resulting mixture was extracted with EtOAc (2 x 100 mL), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated. Biotage purification (40 M cartridge, 1:1:1 EtOAc:hexane:MeOH) afforded 146 mg of Example 176 as a white foam (41%).

A reaction vial equipped with a stir vane was charged with Intermediate 95 (46 mg, 0.133 mmol), acetone (250  $\mu\text{L}$ ), water (500  $\mu\text{L}$ ), and N-methyl morpholine N-oxide (17.1 mg, .146 mmol). To this mixture was added osmium tetroxide in t-butanol (50  $\mu\text{L}$ , .004 mmol, 2.5 wt% solution). The resulting mixture was stirred at room temperature for 24 hours. The reaction mixture then was diluted with 10% aqueous sodium thiosulfate solution (5 mL), filtered through GF/F filter paper. The filtrate was extracted with EtOAc (2 x 10 mL), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated. Biotage purification (12S car-

A round bottom flask equipped with a stir bar and rubber septum was charged with 5-[4-(1-hydroxyethyl)-4-methylpyrrolidin-3-yl]-2-methoxyphenol (2.4 g, 9.55 mmol), dry  $\text{CH}_2\text{Cl}_2$  (50 mls), and DIEA (3.49 mls, 20.1 mmol) under a nitrogen atmosphere. The mixture was chilled to  $0^\circ\text{C}$  and (S)-2,2-dimethyl-[1,3]dioxolane-4-carbonyl chloride (3.14 g, 19.1 mmol) in 15 ml of  $\text{CH}_2\text{Cl}_2$  was added dropwise by syringe. The reaction mixture was allowed to gradually warm to room temperature over a 16-hour period. The mixture then was diluted with 50 ml of  $\text{CH}_2\text{Cl}_2$ , washed with 1N HCl (2x50 ml), saturated aqueous  $\text{NaHCO}_3$  (1x50 ml), dried over  $\text{Na}_2\text{SO}_4$ , and concentrated to 3.9 g of a tan foam. The material was taken up in 100 ml  $\text{CH}_3\text{OH}$  and chilled to  $0^\circ\text{C}$ . Three equivalents of aqueous 1N LiOH then were added (29 ml, 29.0 mmol), the mixture was stirred at  $0^\circ\text{C}$  for 2

hours, then warmed to room temperature for 2 hours. The reaction mixture next was concentrated under reduced pressure with the bath temperature at 30°C to remove CH<sub>3</sub>OH. The remaining aqueous material was  
5 neutralized with saturated NH<sub>4</sub>Cl to pH 7 and extracted with EtOAc (2x100 ml). The extracts were dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated to 2.74 g of a tan foam (76%).

Example 255

1-(R)-[1-(2-Benzyloxyethyl)-4-(S)-(3-cyclopentyloxy-4-methoxyphenyl)-3-(S)-methylpyrrolidin-3-yl]-ethanol

Intermediate 68 (86.4 mg, 0.27 mmol) was dissolved in 1,2-dichloroethane (1 mL) and the solution was treated with benzyloxyacetaldehyde (38  $\mu$ L, 0.27 mmol), followed by sodium triacetoxymethylborohydride (81 mg, 0.38 mmol). The reaction was stirred for 18 hours at room temperature. Additional sodium triacetoxymethylborohydride (40 mg, 0.19 mmol) was added and stirring continued for 8 hours. The reaction mixture was diluted with 1.0 M NaOH (0.5 mL) and stirred vigorously for 15 minutes. The layers were separated, the aqueous phase was washed with  $\text{CH}_2\text{Cl}_2$ , and the organic layers were combined. After washing with 6%  $\text{NaHCO}_3$ , the organics were dried with  $\text{Na}_2\text{SO}_4$ , then concentrated *in vacuo*. The crude material (129 mg) was chromatographed on silica gel with  $\text{CHCl}_3$ /95%

ethanol/conc.  $\text{NH}_4\text{OH}$  (170 : 15 :1), providing Example 255 (27 mg, 22%).

2-Benzyloxy-1-[4-(S)-(3-cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-hydroxymethyl-3-methylpyrrolidin-1-yl]ethanone

[4-(S)-(3-Cyclopropylmethoxy-4-methoxyphenyl)-3-(S)-methylpyrrolidin-3-yl]methanol (100 mg, 0.34 mmol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (1.7 mL), and the solution was cooled to  $0^\circ\text{C}$ . DIEA (144  $\mu\text{L}$ , 0.82 mmol) was added, followed by benzyloxyacetyl chloride (114  $\mu\text{L}$ , 0.72 mmol). The reaction was allowed to warm to room temperature slowly and stirred for 18 hours. Water was added (0.25 mL) and the reaction was stirred for 1.5 hours.  $\text{CH}_2\text{Cl}_2$  was added and the mixture was washed once with water, twice with 1N HCl, once with water, twice with 6%  $\text{NaHCO}_3$ , then dried over  $\text{Na}_2\text{SO}_4$  and concentrated *in vacuo*. The residue was dissolved in THF (1 mL) and cooled to  $0^\circ\text{C}$ . A solution of LiOH in water (1.36M, 1 mL, 1.36

mmol) was added and the hydrolysis was allowed to proceed at 0°C for 4 hours. The reaction mixture was quenched with saturated NH<sub>4</sub>Cl, and the THF was removed by concentration *in vacuo*. The residue was resuspended in CH<sub>2</sub>Cl<sub>2</sub>, and washed twice with 6% NaHCO<sub>3</sub>, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated *in vacuo*.

Oxalyl chloride (2.0 M in CH<sub>2</sub>Cl<sub>2</sub>, 0.175 mL, 0.35mmol) was added to CH<sub>2</sub>Cl<sub>2</sub> (0.52 mL). The resulting solution was cooled to -60°C. A solution of DMSO (47 mL, 0.66 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (0.18 mL) then was

added dropwise. The solution was stirred for 5 minutes and Example 257 (dissolved in 1.0 mL  $\text{CH}_2\text{Cl}_2$ ) added to a Swern oxidation mixture. After the reaction had been stirred for 30 minutes at  $-60^\circ\text{C}$ ,  $\text{Et}_3\text{N}$  (0.25 mL) was added and the reaction mixture was warmed to room temperature. After 30 minutes, water was added and the solution was stirred vigorously for 15 minutes. The layers were separated, the aqueous phase washed once with  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were washed with saturated NaCl, dried over  $\text{Na}_2\text{SO}_4$ , and concentrated *in vacuo*. The crude material was chromatographed on  $\text{SiO}_2$  using EtOAc/hexanes (2:1), (76 mg, 50%).

The compounds of structural formula (II) were tested for an ability to inhibit PDE4. The ability of a compound to inhibit PDE4 activity is related to the  $IC_{50}$  value for the compound, i.e., the concentration of inhibitor required for 50% inhibition of enzyme activity. The  $IC_{50}$  value for compounds of structural formula (II) were determined using recombinant human PDE4.

The *in vitro* phosphodiesterase activity inhibitory  $IC_{50}$  values, and the resulting calculated  $K_i$  values of compounds set forth in the examples were determined by measuring the inhibition of cAMP hydrolysis as a function of the concentration of the test compound over the range of 0 to 1 mM. The  $K_i$  values of the compounds tested in the aforementioned assay ranged from about 0.0003  $\mu M$  to about 100  $\mu M$ .

The compounds of the present invention typically exhibit an  $IC_{50}$  value against recombinant human PDE4 of less than about 50  $\mu M$ , and preferably less than about 25  $\mu M$ , and more preferably less than about 15  $\mu M$ . The compounds of the present invention typically exhibit an  $IC_{50}$  value against recombinant human PDE4 of less than about 1  $\mu M$ , and often less than about 0.05  $\mu M$ . To achieve the full advantage of the present invention, a present PDE4 inhibitor has an  $IC_{50}$  of about 700 pM (picomolar) to about 15  $\mu M$ .

The  $IC_{50}$  values for the compounds were determined from concentration-response curves typically using concentrations ranging from 0.1 pM to 500  $\mu M$ . Tests against other PDE enzymes using standard methodology, as described in Loughney et al., *J. Biol. Chem.*, 271, pp. 796-806 (1996), also showed

that compounds of the present invention are highly selective for the cAMP-specific PDE4 enzyme.

In particular, a compound of the present invention, i.e., Sample 66, has an  $IC_{50}$  vs. human recombinant PDE4B of  $0.015 \mu M$ , but has an  $IC_{50}$  vs. PDE1A of  $80 \mu M$ , vs. PDE1B of  $100 \mu M$ , vs. PDE1C of  $12 \mu M$ , vs. PDE2 of  $450 \mu M$ , vs. PDE3A of  $40 \mu M$ , vs. PDE5 of  $270 \mu M$ , and vs. PDE7 of  $36 \mu M$ . This illustrates the selectivity of the present compound with respect to inhibiting PDE4.

The compounds of structural formula (II) also were tested for an ability to reduce  $TNF\alpha$  secretion in human peripheral blood lymphocytes. The ability to reduce  $TNF\alpha$  secretion is related to the  $EC_{50}$  values (i.e., the effective concentration of the compound capable of inhibiting 50% of the total  $TNF\alpha$ ).

The *in situ* inhibition of  $TNF\alpha$  release derived from endotoxin treated isolated human peripheral blood lymphocytes resulted in  $EC_{50}$  values of compounds set forth in the examples were determined as a function of the concentration of the test compound over a range of 0 to  $100 \mu M$ . The  $EC_{50}$  values of the compounds tested in the aforementioned assay ranged from about  $0.0002 \mu M$  to about  $20 \mu M$ .

The compounds of the present invention typically exhibit an  $EC_{50}$  value of less than about  $50 \mu M$ , and preferably less than about  $25 \mu M$ , and more preferably less than about  $15 \mu M$ . The compounds of the present invention typically exhibit a PBL/ $TNF\alpha$   $EC_{50}$  value of less than about  $1 \mu M$ , and often less than about  $0.05 \mu M$ . To achieve the full advantage of the present invention, a present PDE4 inhibitor

has an  $EC_{50}$  value of about 1000 pM (picomolar) to about 20  $\mu$ M.

The production of recombinant human PDEs and the  $IC_{50}$  and  $EC_{50}$  determinations can be accomplished by well-known methods in the art. Exemplary methods are described as follows:

#### EXPRESSION OF HUMAN PDEs

##### 10 Expression in Baculovirus-Infected Spodoptera fugiperda (Sf9) Cells

Baculovirus transfer plasmids were constructed using either pBlueBacIII (Invitrogen) or pFastBac (BRL-Gibco). The structure of all plasmids was verified by sequencing across the vector junctions and by fully sequencing all regions generated by PCR. Plasmid pBB-PDE1A3/6 contained the complete open reading frame of PDE1A3 (Loughney et al., *J. Biol. Chem.*, 271, pp. 796-806 (1996)) in pBlueBacIII. Plasmid Hcam3aBB contained the complete open reading frame of PDE1C3 (Loughney et al. (1996)) in pBlueBacIII. Plasmid pBB-PDE3A contained the complete open reading frame of PDE3A (Meacci et al., *Proc. Natl. Acad. Sci., USA*, 89, pp. 3721-3725 (1992)) in pBlueBacIII.

Recombinant virus stocks were produced using either the MaxBac system (Invitrogen) or the FastBac system (Gibco-BRL) according to the manufacturer's protocols. In both cases, expression of recombinant human PDEs in the resultant viruses was driven off the viral polyhedron promoter. When using the MaxBac® system, virus was plaque purified

twice in order to insure that no wild type (occ+) virus contaminated the preparation. Protein expression was carried out as follows. Sf9 cells were grown at 27°C in Grace's Insect culture medium (Gibco-BRL) supplemented with 10% fetal bovine serum, 0.33% TC yeastolate, 0.33% lactalbumin hydrolysate, 4.2 mM NaHCO<sub>3</sub>, 10 µg/mL gentamycin, 100 units/mL penicillin, and 100 µg/mL streptomycin. Exponentially growing cells were infected at a multiplicity of approximately 2 to 3 virus particles per cell and incubated for 48 hours. Cells were collected by centrifugation, washed with non-supplemented Grace's medium, and quick-frozen for storage.

#### Expression in *Saccharomyces cerevisiae* (Yeast)

Recombinant production of human PDE1B, PDE2, PDE4A, PDE4B, PDE4C, PDE4D, PDE5, and PDE7 was carried out similarly to that described in Example 7 of U.S. Patent No. 5,702,936, incorporated herein by reference, except that the yeast transformation vector employed, which is derived from the basic ADH2 plasmid described in Price et al., *Methods in Enzymology*, 185, pp. 308-318 (1990), incorporated yeast ADH2 promoter and terminator sequences and the *Saccharomyces cerevisiae* host was the protease-deficient strain BJ2-54 deposited on August 31, 1998 with the American Type Culture Collection, Manassas, Virginia, under accession number ATCC 74465. Transformed host cells were grown in 2X SC-leu medium, pH 6.2, with trace metals, and vitamins. After 24 hours, YEP medium-containing glycerol was added to a

final concentration of 2X YET/3% glycerol. Approximately 24 hr later, cells were harvested, washed, and stored at -70°C.

## 5 CALMODULIN PURIFICATION

Calmodulin used for activation of the PDE1 enzymes was purified from bovine testes essentially as described by Dedman et al., *Methods in Enzymology*, 102, pp. 1-8 (1983) using the Pharmacia Phenyl-Sepharose® procedure.

## IMMOBILIZATION OF CALMODULIN ON AGAROSE

15 Calmodulin was immobilized on BioRad Affi-Gel® 15 per manufacturer's instructions.

## HUMAN PHOSPHODIESTERASE PREPARATIONS

### 20 Phosphodiesterase Activity Determinations

Phosphodiesterase activity of the preparations was determined as follows. PDE assays utilizing a charcoal separation technique were performed essentially as described in Loughney et al. (1996). In this assay, PDE activity converts [32P]cAMP or [32P]cGMP to the corresponding [32P]5'-AMP or [32P]5'-GMP in proportion to the amount of PDE activity present. The [32P]5'-AMP or [32P]5'-GMP then  
30 was quantitatively converted to free [32P]phosphate and unlabeled adenosine or guanosine by the action of snake venom 5'-nucleotidase. Hence, the amount of [32P]phosphate liberated is proportional to en-

zyme activity. The assay was performed at 30°C in a 100 µL reaction mixture containing (final concentrations) 40 mM Tris HCl (pH 8.0), 1 µM ZnSO<sub>4</sub>, 5 mM MgCl<sub>2</sub>, and 0.1 mg/mL bovine serum albumin (BSA).

5 Alternatively, in assays assessing PDE1-specific activity, incubation mixtures further incorporated the use of 0.1 mM CaCl<sub>2</sub> and 10 µg/mL calmodulin. PDE enzyme was present in quantities that yield <30% total hydrolysis of substrate (linear assay condi-  
10 tions). The assay was initiated by addition of substrate (1 mM [32P]cAMP or cGMP), and the mixture was incubated for 12 minutes. Seventy-five (75) µg of *Crotalus atrox* venom then was added, and the incubation was continued for 3 minutes (15 minutes  
15 total). The reaction was stopped by addition of 200 µL of activated charcoal (25 mg/mL suspension in 0.1 M NaH<sub>2</sub>PO<sub>4</sub>, pH 4). After centrifugation (750 X g for 3 minutes) to sediment the charcoal, a sample of the supernatant was taken for radioactivity determina-  
20 tion in a scintillation counter and the PDE activity was calculated.

Inhibitor analyses were performed similarly to the method described in Loughney et al., *J. Biol. Chem.*, 271, pp. 796-806 (1996), except both  
25 cGMP and cAMP were used, and substrate concentrations were kept below 32 nM, which is far below the K<sub>m</sub> of the tested PDEs.

#### Purification of PDE1A3 from SF9 Cells

30

Cell pellets (5 g) were mixed with 10 mL of Lysis Buffer (50 mM MOPS pH 7.5, 2 mM dithiothreitol (DTT), 2 mM benzamidine HCl, 5 µM ZnSO<sub>4</sub>,

0.1 mM  $\text{CaCl}_2$ , 20  $\mu\text{g/mL}$  calpain inhibitors I and II, and 5  $\mu\text{g/mL}$  each of leupeptin, pepstatin, and aprotinin) at room temperature. The cells were lysed by passage through a French<sup>®</sup> pressure cell (SLM-  
5 Aminco<sup>®</sup>, Spectronic Instruments, Inc., Rochester NY). The resultant lysate was centrifuged in a Beckman ultracentrifuge using a type T180 rotor at 45,000 rpm for 1 hr. The supernatant was recovered and filtered through a 0.2  $\mu\text{m}$  filter. This filtrate  
10 was applied to a 2.6 X 90 cm column of SEPHACRYL<sup>®</sup> S-300 equilibrated in Column Buffer A (Lysis Buffer containing 100 mM NaCl, and 2 mM  $\text{MgCl}_2$ ). The column flow rate was adjusted to 1 mL/min and fractions of 7 mL were collected. Active fractions were pooled  
15 and supplemented with 0.16 mg of calmodulin. The enzyme was applied overnight at a flow rate of 0.2 mL/min to an ACC-1 agarose immunoaffinity column as described in Hansen et al., *Methods in Enzymology* 159, pp. 453-557 (1988). The column was washed with  
20 5 volumes of Column Buffer B (Column Buffer A without NaCl) and followed by 5 volumes of Column Buffer C (Column Buffer A containing 250 mM NaCl). The column was eluted with Column Buffer D (50 mM MOPS pH 7.5, 1 mM EDTA, 1 mM EGTA, 1 mM DTT, 1 mM  
25 benzamidine HCl, 100 mM NaCl, 20  $\mu\text{g/mL}$  calpain inhibitors I and II, and 5  $\mu\text{g/mL}$  each of leupeptin, pepstatin, and aprotinin) by applying one column volume at 0.1 mL/min, stopping flow for 1 hour, and then continuing elution at the same flow rate.  
30 Fractions of 0.5 mL were collected. Fractions displaying activity were pooled, and first dialyzed against dialysis buffer containing 25 mM MOPS pH 7.5, 100 mM NaCl, 10  $\mu\text{M}$   $\text{ZnSO}_4$ , 1 mM  $\text{CaCl}_2$ , 1 mM DTT,

and 1 mM benzamidine HCl. A subsequent dialysis against dialysis buffer containing 50% glycerol was performed prior to quick-freezing the sample with dry ice and storage at -70°C. The resultant preparations were about 10 to 15% pure by SDS-PAGE. These preparations had specific activities of about 5 to 20  $\mu$ mol cAMP hydrolyzed per minute per milligram protein.

10 Purification of PDE1B from *S. cerevisiae*

Yeast cells (50 g) were thawed by mixing with 100 mL glass beads (0.5 mM, acid washed) and 200 mL Buffer A at room temperature. Buffer A consisted of 50 mM MOPS pH 7.5, 1 mM DTT, 2 mM benzamidine HCl, 0.01 mM ZnSO<sub>4</sub>, 5 mM MgCl<sub>2</sub>, 20  $\mu$ g/mL calpain inhibitors I and II, and 5  $\mu$ g/mL each of leupeptin, pepstatin, and aprotinin. The mixture was cooled to 4°C, transferred to a Bead-Beater®, and the cells lysed by rapid mixing for 6 cycles of 30 seconds each. The homogenate was centrifuged for 15 minutes in a Beckman J2-21M centrifuge using a JA-10 rotor at 9,000 rpm and 4°C. The supernatant was recovered and centrifuged in a Beckman XL-80 ultracentrifuge using a TI45 rotor at 36,000 rpm for 45 minutes at 4°C. The supernatant was recovered and PDE1B was precipitated by the addition of solid ammonium sulfate (0.33 g/mL supernatant) while stirring in an ice bath and maintaining the pH between 7.0 and 7.5. This mixture then was centrifuged for 22 minutes in a Beckman J2 centrifuge using a JA-10 rotor at 9,000 rpm (12,000 X g). The supernatant was discarded and the pellet was dissolved in 100 mL of buffer B (50

mM MOPS pH 7.5, 1 mM DTT, 1 mM benzamidine HCl, 0.01 mM ZnSO<sub>4</sub>, 2 mM MgCl<sub>2</sub>, 2 mM CaCl<sub>2</sub>, and 5 µg/mL each of leupeptin, pepstatin, and aprotinin). The pH and conductivity were corrected to 7.5 and 15-20 milli-Siemens (mS), respectively. This solution was loaded onto a 20 mL column of calmodulin-Agarose that had been equilibrated with 10 column volumes of Buffer B at a rate of 1 mL/min. The flow-through was reapplied to the column at least 5 times. The column was washed with 5 volumes of Buffer B, 5 volumes of buffer B containing 250 mM NaCl, and 2 volumes of Buffer B without NaCl again. Elution was accomplished by applying one volume of Buffer C (50 mM MOPS pH 7.5, 1 mM EDTA, 1 mM EGTA, 1 mM DTT, 1 mM benzamidine HCl) at 0.33 mL/min, then stopping flow for 1 hour before continuing the elution. Fractions of about 4 mL were collected and assayed for PDE activity. Active fractions were pooled and concentrated to a volume of 5 mL, using an Amicon ultra-filtration system. The concentrate was then applied to a 320 mL Sephacryl® S-300 column (1.6 X 150 cm) that had been equilibrated with at least 2 volumes of Buffer D (25 mM MOPS pH 7.5, 1 mM DTT, 1 mM benzamidine HCl, 0.01 mM ZnSO<sub>4</sub>, 2 mM CaCl<sub>2</sub>, and 100 mM NaCl). The column was developed at a flow rate of 1 mL/min (11 cm/hr), and 5 mL fractions were collected. The activity peak was pooled and dialyzed overnight against Buffer D containing 50% glycerol. The purified enzyme was frozen on dry ice and stored at -70°C. The resultant preparations were about >90% pure by SDS-PAGE. These preparations had specific activities of about 10 to 30 µmol cGMP hydrolyzed per minute per milligram protein.

Purification of PDE1C3 from Sf9 Cells

Cell pellets (5 g) were thawed on ice with 20 mL of Lysis Buffer (50 mM MOPS pH 7.4, 10  $\mu$ M ZnSO<sub>4</sub>, 0.1 mM CaCl<sub>2</sub>, 1 mM DTT, 2 mM benzamidine HCl, 5  $\mu$ g/mL each of pepstatin, leupeptin, and aprotinin). Cells were lysed by passage through a French® pressure cell (SLM-Aminco®, Spectronic Instruments) while temperatures were maintained below 10°C. The resultant cell homogenate was centrifuged at 36,000 rpm at 4°C for 45 min in a Beckman ultracentrifuge using a Type TI45 rotor. The supernatant was discarded and the resultant pellet was resuspended with 40 mL of Solubilization Buffer (Lysis Buffer containing 1 M NaCl, 0.1 M MgCl<sub>2</sub>, 1 mM CaCl<sub>2</sub>, 20  $\mu$ g/mL calmodulin, and 1% SulfoBetaine SB12 (Z3-12) by sonicating using a VibraCell tuner with a microtip for 3 X 30 seconds. This was performed in a crushed ice/salt mix for cooling. Following sonication, the mixture was slowly mixed for 30 minutes at 4°C to finish solubilizing membrane bound proteins. This mixture was centrifuged in a Beckman ultracentrifuge using a type TI45 rotor at 36,000 rpm for 45 minutes. The supernatant was diluted with Lysis Buffer containing 10  $\mu$ g/mL calpain inhibitors I and II. The precipitated protein was centrifuged for 20 minutes at 9,000 rpm in a Beckman JA-10 rotor. The recovered supernatant then was subjected to Mimetic Blue® AP Agarose Chromatography.

To run the Mimetic Blue® AP Agarose Column, the resin initially was shielded by the application of 10 bed volumes of 1% polyvinylpyrrolidone (i.e., MW of 40,000) to block nonspecific binding

sites. The loosely bound PVP-40 was removed by washing with 10 bed volumes of 2 M NaCl, and 10 mM sodium citrate pH 3.4. Just prior to addition of the solubilized PCE1C3 sample, the column was  
5 equilibrated with 5 bed volumes of Column Buffer A (50 mM MOPS pH 7.4, 10  $\mu$ M ZnSO<sub>4</sub>, 5 mM MgCl<sub>2</sub>, 0.1 mM CaCl<sub>2</sub>, 1 mM DTT, 2 mM benzamidine HCl).

The solubilized sample was applied to the column at a flow rate of 2 mL/min with recycling  
10 such that the total sample was applied 4 to 5 times in 12 hours. After loading was completed, the column was washed with 10 column volumes of Column Buffer A, followed by 5 column volumes of Column Buffer B (Column Buffer A containing 20 mM 5'-AMP),  
15 and followed by 5 column volumes of Column Buffer C (50 mM MOPS pH 7.4, 10  $\mu$ M ZnSO<sub>4</sub>, 0.1 mM CaCl<sub>2</sub>, 1 mM DTT, and 2 mM benzamidine HCl). The enzyme was eluted into three successive pools. The first pool consisted of enzyme from a 5-bed volume wash with  
20 Column Buffer C containing 1 mM cAMP. The second pool consisted of enzyme from a 10-bed volume wash with Column Buffer C containing 1 M NaCl. The final pool of enzyme consisted of a 5-bed volume wash with Column Buffer C containing 1 M NaCl and 20 mM cAMP.

25 The active pools of enzyme were collected and the cyclic nucleotide removed via conventional gel filtration chromatography or chromatography on hydroxyapatite resins. Following removal of cyclic nucleotides, the enzyme pools were dialyzed against  
30 Dialysis Buffer containing 25 mM MOPS pH 7.4, 10  $\mu$ M ZnSO<sub>4</sub>, 500 mM NaCl, 1 mM CaCl<sub>2</sub>, 1 mM DTT, 1 mM benzamidine HCl, followed by dialysis against Dialysis buffer containing 50% glycerol. The enzyme was

quick-frozen with the aid of dry ice and stored at -70°C.

The resultant preparations were about >90% pure by SDS-PAGE. These preparations had specific activities of about 0.1 to 1.0  $\mu$ mol cAMP hydrolyzed per minute per milligram protein.

Purification of PDE2 from *S. cerevisiae*

10                Frozen yeast cell pellets from strain YI34 (10g, stored at -70°C) were allowed to thaw on ice in 25 mL of Lysis Buffer (50 mM MOPS, pH 7.2, 1 mM EDTA, 1 mM EGTA, 0.1 mM DTT, 0.1 mM 4-(2-amino-ethyl)benzenesulfonyl fluoride (AEBSF), 1  $\mu$ g/mL of  
15    pepstatin, leupeptin, aprotinin, calpain inhibitors I and II, and 2 mM benzamidine). Cells were lysed by three passages through a French® pressure cell (SLM-Aminco®, Spectronic Instruments). The lysate was centrifuged at 36,000 rpm in a Beckman Ultracentrifuge rotor Type 45Ti for 60 minutes at 4°C. The  
20    supernatant was separated from sediment and passed through a 15 mL Epoxy-cGMP Sepharos® resin at 4°C two times at about 0.5 mL/min. The column subsequently was washed with 45 mL of Wash Buffer 1 (50  
25    mM MOPS, pH 7.2, 0.1 mM EDTA, 0.1 mM DTT). Following this wash, the column was washed with 45 mL of Wash Buffer 2 (Wash Buffer 1 containing 0.5 M NaCl). Following this salt wash, the column was washed with  
30    15 mL of Wash Buffer 3 (Wash Buffer 1 containing 0.25 M NaCl). The column was transferred to room temperature and allowed to warm. Approximately 25 mL of Elution Buffer (Wash Buffer 3 containing 10 mM cGMP, maintained at room temperature) was applied to

the column and the effluent was collected in 2 mL fractions. Small aliquots of each of the fractions were diluted 20-fold in PBS containing 5 mM MgCl<sub>2</sub> to allow hydrolysis of the competing ligand and to aid  
5 detection of PDE2 activity. Active fractions were passed through a Pharmacia PD-10<sup>®</sup> gel filtration column to exchange into Wash Buffer 3. This exchanged pool was diluted 50% v/v with sterile 80% glycerol and stored at -20°C. The resultant preparations were greater than 85% pure as judged by SDS-  
10 PAGE with subsequent staining of protein by Coomassie R-250. These preparations had specific activities of about 150 to 250  $\mu$ mol cGMP hydrolyzed per minute per milligram protein.

#### Preparation of PDE3A from Sf9 Cells

Cells (2 X 10<sup>10</sup>) were suspended in Lysis Buffer containing 50 mM MOPS pH 7.5, 2 mM DTT, 2 mM  
20 benzamidine HCl, 5  $\mu$ M ZnSO<sub>4</sub>, 0.1 mM CaCl<sub>2</sub>, 20  $\mu$ g/mL calpain inhibitors I and II, and 5  $\mu$ g/mL each of leupeptin, pepstatin, and aprotinin. The mixture was sonicated twice for 30 seconds and the cells were lysed in a French<sup>®</sup> pressure cell (SLM-Aminco<sup>®</sup>,  
25 Spectronic Instruments) at 4°C. The lysate was centrifuged 100,000 X g for 45 minutes. The pellet was washed once in Lysis Buffer and suspended in 46 mL Lysis Buffer with a Dounce homogenizer. Aliquots were stored at -70°C. These preparations had specific  
30 activities of about 1 to 2 nmol cAMP hydrolyzed per minute per milligram protein.

Human PDE4A, 4B, 4C, 4D Preparations

Preparation of PDE4A from *S. cerevisiae*

5                   Yeast cells (50 g of yeast strain YI26  
harboring HDUN1.46) were thawed at room temperature  
by mixing with 50 mL of Lysis Buffer (50 mM MOPS pH  
7.5, 10  $\mu$ M ZnSO<sub>4</sub>, 2 mM MgCl<sub>2</sub>, 14.2 mM 2-mercapto-  
ethanol, 5  $\mu$ g/mL each of pepstatin, leupeptin,  
10 aprotinin, 20  $\mu$ g/mL each of calpain inhibitors I and  
II, and 2 mM benzamidine HCl). Cells were lysed in  
a French® pressure cell (SLM-Aminco®, Spectronic  
Instruments) at 10°C. The extract was centrifuged  
in a Beckman JA-10 rotor at 9,000 rpm for 22 minutes  
15 at 4°C. The supernatant was removed and centrifuged  
in a Beckman TI45 rotor at 36,000 rpm for 45 minutes  
at 4°C.

PDE4A was precipitated from the high-speed  
supernatant by the addition of solid ammonium sul-  
20 fate (0.26 g/mL supernatant) while stirring in an  
ice bath and maintaining the pH between 7.0 and 7.5.  
The precipitated proteins containing PDE4A were  
collected via centrifugation in a Beckman JA-10  
rotor at 9,000 rpm for 22 minutes. The precipitate  
25 was resuspended in 50 mL of Buffer G (50 mM MOPS pH  
7.5, 10  $\mu$ M ZnSO<sub>4</sub>, 5 mM MgCl<sub>2</sub>, 100 mM NaCl, 14.2 mM 2-  
mercaptoethanol, 2 mM benzamidine HCl, 5  $\mu$ g/mL each  
of leupeptin, pepstatin, and aprotinin, and 20  $\mu$ g/mL  
each of calpain inhibitors I and II) and passed  
30 through a 0.45  $\mu$ m filter.

The resuspended sample (50 to 100 mL) was  
loaded onto a 5 X 100 cm column of Pharmacia  
SEPHACRYL® S-300 equilibrated in Buffer G. Enzyme

activity was eluted at a flow rate of 2 mL/min and pooled for later fractionation.

The PDE4A isolated from gel filtration chromatography was applied to a 1.6 X 20 cm column of Sigma Cibacron Blue Agarose-type 300 (10 mL) equilibrated in Buffer A (50 mM MOPS pH 7.5, 10  $\mu$ M ZnSO<sub>4</sub>, 5 mM MgCl<sub>2</sub>, 14.2 mM 2-mercaptoethanol, and 100 mM benzamidine HCl). The column was washed in succession with 50 to 100 mL of Buffer A, 20 to 30 mL of Buffer A containing 20 mM 5'-AMP, 50 to 100 mL of Buffer A containing 1.5 M NaCl, and 10 to 20 mL of Buffer C (50 mM Tris HCl pH 8, 10  $\mu$ M ZnSO<sub>4</sub>, 14.2 mM 2-mercaptoethanol, and 2 mM benzamidine HCl). The enzyme was eluted with 20 to 30 mL of Buffer C containing 20 mM cAMP.

The PDE activity peak was pooled, and precipitated with ammonium sulfate (0.33 g/mL enzyme pool) to remove excess cyclic nucleotide. The precipitated proteins were resuspended in Buffer X (25 mM MOPS pH 7.5, 5  $\mu$ M ZnSO<sub>4</sub>, 50 mM NaCl, 1 mM DTT, and 1 mM benzamidine HCl), and desalted via gel filtration on a Pharmacia PD-10<sup>®</sup> column per manufacturer's instructions. The enzyme was quick-frozen in a dry ice/ethanol bath and stored at -70°C.

The resultant preparations were about >80% pure by SDS-PAGE. These preparations had specific activities of about 10 to 40  $\mu$ mol cAMP hydrolyzed per minute per milligram protein.

Preparation of PDE4B from *S. cerevisiae*

Yeast cells (150 g of yeast strain Y123 harboring HDUN2.32) were thawed by mixing with 100 mL glass beads (0.5 mM, acid washed) and 150 mL Lysis Buffer (50 mM MOPS pH 7.2, 2 mM EDTA, 2 mM EGTA, 1 mM DTT, 2 mM benzamidine HCl, 5  $\mu$ g/mL each of pepstatin, leupeptin, aprotinin, calpain inhibitors I and II) at room temperature. The mixture was cooled to 4°C, transferred to a Bead-Beater®, and the cells lysed by rapid mixing for 6 cycles of 30 seconds each. The homogenate was centrifuged for 22 minutes in a Beckman J2-21M centrifuge using a JA-10 rotor at 9,000 rpm and 4°C. The supernatant was recovered and centrifuged in a Beckman XL-80 ultracentrifuge using a TI45 rotor at 36,000 rpm for 45 minutes at 4°C. The supernatant was recovered and PDE4B was precipitated by the addition of solid ammonium sulfate (0.26 g/mL supernatant) while stirring in an ice bath and maintaining the pH between 7.0 and 7.5. This mixture was then centrifuged for 22 minutes in a Beckman J2 centrifuge using a JA-10 rotor at 9,000 rpm (12,000 X g). The supernatant was discarded and the pellet was dissolved in 200 mL of Buffer A (50 mM MOPS pH 7.5, 5 mM MgCl<sub>2</sub>, 1 mM DTT, 1 mM benzamidine HCl, and 5  $\mu$ g/mL each of leupeptin, pepstatin, and aprotinin). The pH and conductivity were corrected to 7.5 and 15-20 mS, respectively.

The resuspended sample was loaded onto a 1.6 X 200 cm column (25 mL) of Sigma Cibacron Blue Agarose-type 300 equilibrated in Buffer A. The sample was cycled through the column 4 to 6 times over the course of 12 hours. The column was washed

in succession with 125 to 250 mL of Buffer A, 125 to 250 mL of Buffer A containing 1.5 M NaCl, and 25 to 50 mL of Buffer A. The enzyme was eluted with 50 to 75 mL of Buffer E (50 mM Tris HCl pH 8, 2 mM EDTA, 2 mM EGTA, 1 mM DTT, 2 mM benzamidine HCl, and 20 mM cAMP) and 50 to 75 mL of Buffer E containing 1 M NaCl. The PDE activity peak was pooled, and precipitated with ammonium sulfate (0.4 g/mL enzyme pool) to remove excess cyclic nucleotide. The precipitated proteins were resuspended in Buffer X (25 mM MOPS pH 7.5, 5  $\mu$ M ZnSO<sub>4</sub>, 50 mM NaCl, 1 mM DTT, and 1 mM benzamidine HCl) and desalted via gel filtration on a Pharmacia PD-10<sup>®</sup> column per manufacturer's instructions. The enzyme pool was dialyzed overnight against Buffer X containing 50% glycerol. This enzyme was quick-frozen in a dry ice/ethanol bath and stored at -70°C.

The resultant preparations were about >90% pure by SDS-PAGE. These preparations had specific activities of about 10 to 50  $\mu$ mol cAMP hydrolyzed per minute per milligram protein.

Yeast cells (150 g of yeast strain YI30 harboring HDUN3.48) were thawed by mixing with 100 mL glass beads (0.5 mM, acid washed) and 150 mL Lysis Buffer (50 mM MOPS pH 7.2, 2 mM EDTA, 2 mM EGTA, 1 mM DTT, 2 mM benzamidine HCl, 5  $\mu$ g/mL each of pepstatin, leupeptin, aprotinin, calpain inhibitors I and II) at room temperature. The mixture was cooled to 4°C, transferred to a BEAD-BEATER<sup>®</sup>, and the cells lysed by rapid mixing for 6 cycles of 30

sec each. The homogenate was centrifuged for 22 minutes in a Beckman J2-21M centrifuge using a JA-10 rotor at 9,000 rpm and 4°C. The supernatant was recovered and centrifuged in a Beckman XL-80 ultra-  
5 centrifuge using a TI45 rotor at 36,000 rpm for 45 minutes at 4°C.

The supernatant was recovered and PDE4C was precipitated by the addition of solid ammonium sulfate (0.26 g/mL supernatant) while stirring in an  
10 ice bath and maintaining the pH between 7.0 and 7.5. Thirty minutes later, this mixture was centrifuged for 22 minutes in a Beckman J2 centrifuge using a JA-10 rotor at 9,000 rpm (12,000 X g). The supernatant was discarded and the pellet was dissolved in  
15 200 mL of Buffer A (50 mM MOPS pH 7.5, 5 mM MgCl<sub>2</sub>, 1 mM DTT, 2 mM benzamidine HCl, and 5 µg/mL each of leupeptin, pepstatin, and aprotinin). The pH and conductivity were corrected to 7.5 and 15-20 mS, respectively.

Purification of PDE5 from *S. cerevisiae*

Cell pellets (29 g) were thawed on ice with an equal volume of Lysis Buffer (25 mM Tris HCl, pH 8, 5 mM  $MgCl_2$ , 0.25 mM DTT, 1 mM benzamidine, and 10  $\mu$ M  $ZnSO_4$ ). Cells were lysed in a Microfluidizer® (Microfluidics Corp.) using nitrogen at 20,000 psi. The lysate was centrifuged and filtered through 0.45  $\mu$ m disposable filters. The filtrate was applied to a 150 mL column of Q SEPHAROSE® Fast-Flow (Pharmacia). The column was washed with 1.5 volumes of Buffer A (20 mM Bis-Tris Propane, pH 6.8, 1 mM  $MgCl_2$ , 0.25 mM DTT, 10  $\mu$ M  $ZnSO_4$ ) and eluted with a step gradient of 125 mM NaCl in Buffer A followed by a linear gradient of 125-1000 mM NaCl in Buffer A. Active fractions from the linear gradient were applied to a 180 mL hydroxyapatite column in Buffer B (20 mM Bis-Tris Propane (pH 6.8), 1 mM  $MgCl_2$ , 0.25 mM DTT, 10  $\mu$ M  $ZnSO_4$ , and 250 mM KCl). After loading, the column was washed with 2 volumes of Buffer B and eluted with a linear gradient of 0-125 mM potassium phosphate in Buffer B. Active fractions were pooled, precipitated with 60% ammonium sulfate, and resuspended in Buffer C (20 mM Bis-Tris Propane, pH 6.8, 125 mM NaCl, 0.5 mM DTT, and 10  $\mu$ M  $ZnSO_4$ ). The pool was applied to a 140 mL column of SEPHACRYL® S-300 HR and eluted with Buffer C.

Active fractions were diluted to 50% glycerol and stored at -20°C.

The resultant preparations were about 85% pure by SDS-PAGE. These preparations had specific activities of about 3  $\mu$ mol cGMP hydrolyzed per minute per milligram protein.

Cell pellets (126 g) were thawed and re-suspended at room temperature for about 30 minutes with an equal volume of Lysis Buffer (50 mM Tris HCl, pH 8, 1 mM EDTA, 1 mM DTT, 50 mM NaCl, 2 mM benzamidine HCl, and 5  $\mu$ g/mL each of pepstatin, leupeptin, and aprotinin). The cells were lysed at 0-4°C with the aid of glass beads (125 mL) in a Bead-Beater® for 6 X 30 second cycles. The lysate was centrifuged and filtered through 0.45  $\mu$ m disposable filters. The filtered extract (178 mL) was distributed into 4 mL aliquots, quick-frozen with dry ice, and stored in a freezer at -70°C. These preparations were stable to several cycles of freezing and thawing and had specific activities of about 50 to 100 pmol cAMP hydrolyzed per minute per milligram protein.

#### Lipopolysaccharide-Stimulated TNF $\alpha$ Release from Human Peripheral Blood Lymphocytes

To assess the ability of a compound to reduce TNF $\alpha$  secretion in human peripheral blood lymphocytes (PBL), the following tests were performed. Previous studies have demonstrated that

incubation of human PBL with cAMP-elevating agents, such as prostaglandin E21, forskolin, 8-bromo-cAMP, or dibutryl-cAMP, inhibits the secretion of TNF $\alpha$  by the cells when stimulated by lipopolysaccharide (LPS; endotoxin). Accordingly, preliminary experiments have been performed to demonstrate that selective PDE4 inhibitors, such as rolipram, inhibit LPS-induced TNF $\alpha$  secretion from human lymphocytes in a dose-dependent fashion. Hence, TNF $\alpha$  secretion from human PBL was used as a standard for the ability of a compound to elevate intracellular cAMP concentrations and/or to inhibit PDE4 activity within the cell.

Heparinized blood (approximately 30 mL) drawn from human volunteers was mixed 1:1 with Dulbecco's modified phosphate-buffered saline. This mixture was mixed 1:1 with HISTOPAQUE<sup>®</sup> and centrifuged at 1,500 rpm at room temperature without braking in the swinging bucket of a Beckman model TJ6 centrifuge. Erythrocytes were centrifuged to the bottom of the tubes, and serum remained at the surface of the tubes. A layer containing lymphocytes sedimented between the serum and HISTOPAQUE<sup>®</sup> layers, and was removed by aspiration to a fresh tube. The cells were quantified and adjusted to  $3 \times 10^6$  cells/mL and a 100  $\mu$ L aliquot is placed into the wells of a 96 well plate. Test compounds and RPMI media (Gibco/BRL Life Sciences) are added to each of the wells 15 minutes prior to addition of bacterial LPS (25 mg/mL). The mixture was allowed to incubate for 20 hours at 37°C in a humidified chamber. The cells then were separated by centrifuging at 800 rpm for 5 minutes at room temperature. An aliquot of

180  $\mu$ L of supernatant was transferred to a new plate for determination of TNF $\alpha$  concentration. TNF $\alpha$  protein in the cell supernatant fluids was measured using a commercially available enzyme-linked immunosorbent assay (ELISA) (CYTOSCREEN<sup>®</sup> Immunoassay Kit from Biosource International).

The cell-based assay provided the following results for various pyrrolidine compounds of the present invention. The EC<sub>50</sub> values (i.e., effective concentration of the compound capable of inhibiting 50% of the total TNF $\alpha$ ) illustrate the ability of the present compounds to inhibit LPS-stimulated TNF $\alpha$  release from human PBL.

The table below illustrates the ability of compounds of formula (II) to inhibit PDE4 activity and TNF $\alpha$  release *in vitro*. In the following table, the IC<sub>50</sub> values were determined against human recombinant PDE4.

10

The data presented above shows that the present compounds are potent inhibitors of PDE4, e.g., the compounds have an IC<sub>50</sub> vs. human recombinant PDE4 of about 700 pM to about 15 μM. Preferred compounds have an IC<sub>50</sub> of about 100 nM or less, and especially preferred compounds have an IC<sub>50</sub> of about 50 nM or less.

15

Similarly, preferred compounds have a PBL/TNFα EC<sub>50</sub> about 500 nM or less, and preferably about 200 nM or less. More preferred compounds have a PBL/TNFα EC<sub>50</sub> of about 100 nM or less.

20

To achieve the full advantages of the present invention, the compounds have an IC<sub>50</sub> vs. human recombinant PDE4 of about 100 nM or less and a PBL/TNFα EC<sub>50</sub> of about 500 nM or less. More preferably, the compounds have an IC<sub>50</sub> of about 50 nM or less and a PBL/TNFα EC<sub>50</sub> of about 100 nM or less.

Animal Models

Assay for Inhibition of  
Serum TNF $\alpha$  Levels in Mammals  
5 (Mouse/TNF $\alpha$  ED<sub>50</sub> (mg/kg))

In order to assess the ability of a compound to reduce serum TNF $\alpha$  levels in mammals, the following protocol was employed. Those skilled in the art appreciate that previous studies have demonstrated that incubation of LPS-activated human monocytes with agents that can elevate cAMP, like PGE<sub>2</sub>, forskolin, and the dbcAMP, inhibited secretion of TNF $\alpha$ . PDE4 inhibitors like rolipram, which also elevate cAMP, have been found to inhibit serum TNF $\alpha$  as well. Rolipram has also been found to inhibit secretion of TNF $\alpha$  from LPS-activated mouse macrophages. Accordingly, *in vivo* efficacy of a PDE4 reducing compound was shown by dosing with compound and measuring reduction of serum TNF $\alpha$  levels in LPS-injected mice. Female C3H mice, 20-25 gm body weight, were fasted overnight and dosed intraperitoneally with test compound in appropriate vehicle 60 minutes before LPS injection. Five  $\mu$ g of LPS was then injected intraperitoneally into the mice. Ninety minutes after LPS injection, mice were bled from the heart. Blood was allowed to clot overnight at 4°C. Samples were centrifuged for 10 minutes in a microcentrifuge and the serum removed and stored at -20°C until analysis. Serum levels of TNF $\alpha$  were subsequently measured using a commercially available ELISA kit (Genzyme) following the protocol enclosed in the kit. The percent of inhibition of serum TNF $\alpha$

levels caused by the compound was determined relative to serum TNF $\alpha$  levels in control mice receiving vehicle alone.

5 **Combined Mouse endotoxin-stimulated TNF $\alpha$**   
**Release and Locomotor Activity Assay (ED<sub>50</sub> (mg/kg))**

10 The purpose of this study was to determine the efficacy of PDE4 inhibitors *in vivo* in an LPS mouse model together with a determination with respect to central nervous system (CNS) side-effects manifested by a decrease in spontaneous mobility.

The test animals were female Balb/c mice, 15 having an average weight of about 20 g. The PDE4 inhibitors, formulated in 30% Cremophor® EL, were administered via intraperitoneal (i.p.) injections at doses of 0.1, 1.0, 10.0, and 100 mg/kg. Individual dose volumes (about 150  $\mu$ L) were adjusted based 20 on the body weights measured. One hour later, 5 mg/kg LPS in a final volume of 200  $\mu$ L was injected via the tail vein to each animal. Ninety minutes following the LPS treatment, the animals were bled and serum samples were collected before being stored 25 at -70°C until assayed.

For efficacy determination, the serum samples were diluted two-fold and TNF $\alpha$  levels were determined using the CYTOSCREEN® Immunoassay Kit (Biosource International). The data were averaged 30 between triplicate sample subjects for each of the tested compounds.

Movement of the X-Y plane, or rearing up on the hind legs, was quantified by counting the number of "light-beam" crosses per unit of time. A

decrease in the number of activity events is directly proportional to the mobility or immobilization of the animal. The quantitative scoring correlated well with the subjective measurements described above.

The following table summarizes the Mouse/ $\text{TNF}\alpha$   $\text{ED}_{50}$  (mg/kg) results obtained by the above-described method:

31	3	83
61	0.2	>50

69	7	<0.5

<sup>1)</sup> effective dose, in mg/kg, that decreases spontaneous mobility 50% of control.

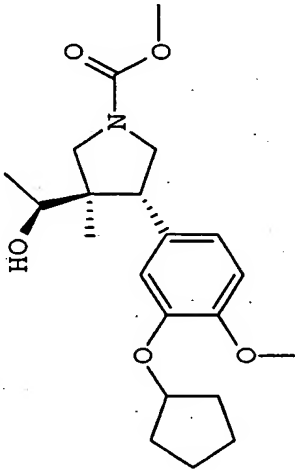

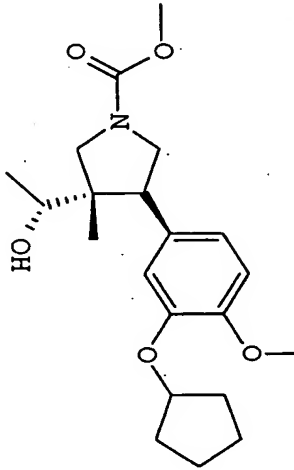

It also was determined that compounds of formula (II) have fewer central nervous system side effects compared to rolipram and to compounds disclosed in Feldman et al. U.S. Patent No. 5,665,754. It also was found that central nervous system activity is related to the absolute stereochemistry of the present compounds.

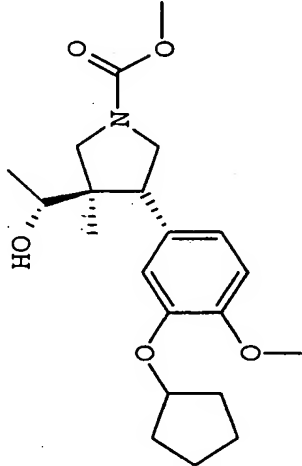

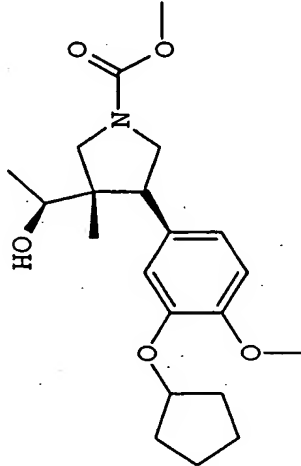

It is known that stereoisomers of drugs can have substantially different biological activities, e.g., potency, selectivity, absorption, dis-

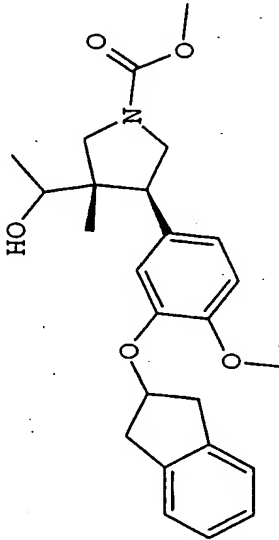

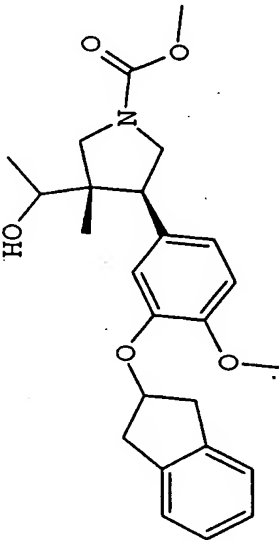

tribution, metabolism, execution, and side effect profiles. In the present invention, the enantiomers and diastereomers represented by compounds (A) - (D) in the following table were tested for effects on *in vitro* PDE activity, cell-based LPS/TNF $\alpha$  release from human peripheral blood lymphocytes (PBLs), mouse mobility, and ferret emesis.

As shown in the following table, compounds (C) and (A) (i.e., Samples 66 and 69, respectively) show similar inhibition of PDE4 and LPS-stimulated TNF $\alpha$  release, but substantially different behavioral profiles. Compounds (C) and (A), which exhibit less CNS activity, are derived from the predominant product of the [3+2] azomethine ylide cyclization to the chiral  $\alpha,\beta$ -unsaturated amide. Thus, the absolute stereochemistry of a PDE4 inhibitor of the present invention contributes significantly to the behavioral profile of the compound.

1) CNS side effects were determined by a subjective assessment of mouse immobility following injection of compounds i.p. at 1, 10, and 100 mg/kg doses. Mobility (or lack thereof) assessment was scored by observing the following: reduced exploratory behavior, fattened posture, prone positioning, ruffled fur, etc. No apparent effects were noted over the 60 minutes time frame of assessment with Examples 8(C), 8(D), and 8(B). However, mice were affected at all doses when given Example 8(A). Furthermore, at the highest dose of Example 8(A), mice became moribund and died within 10 minutes of treatment.

The data presented above show that compounds of formula (II) are potent and selective inhibitors of PDE4. As an important added advantage, the compounds of formula (II) also reduced or eliminated the adverse CNS side effects associated with prior PDE4 inhibitors. Compounds of formula (II) were further tested for emetogenic properties in animal models to further illustrate the efficacy of the compounds. The method and results of the emetogenic test are set forth below.

**Emetic Modeling in the Ferret Following  
Oral and Intravenous Dosing With  
PDE4-Selective Inhibitors**

15

This study was conducted to investigate the emetogenic properties of PDE4 inhibitors *in vivo*. The ferret previously has been established as a valuable tool for assessing emesis following exposure to test compounds. Previous studies indicated that the emetic response of a ferret to many PDE4 inhibitors is predictive of the disposition of humans toward the same test compounds. Therefore, lack of and/or decrease in emetic potential of test compounds in ferrets predicts a favorable nonemetic effect in humans. Emesis is a complex physiological response to noxious agents that can be initiated peripherally or centrally. Hence, PDE4-selective agents were tested when administered both intravenously or orally.

The test animals were adult, castrated, and descended male ferrets (species=*Mustela putorius furo*, Strain=Sable) ranging in weight from about 1

to 1.5 kg. The tests were performed in quadruplicate on animals that were naive to PDE4 inhibitors. The PDE4 inhibitors were formulated in 10% Polyoxyl-35 castor oil (CREMOPHOR® EL, available  
5 from BASF Corporation, Parsippany, NJ) in phosphate buffered saline (PBS), and were administered via i.v. injections into an indwelling catheter surgically positioned in the right external jugular vein at a rate of 0.66 mL per kg body weight. PDE4 in-  
10 hibitors for oral consumption were formulated in 30% CREMOPHOR® EL in PBS, and administered by intubating animals with a 16-gauge feeding needle into the stomach. The animals received the PDE4 inhibitors in a volume of 1.33 mL per kg body weight.

15 All animals were fasted for 8 to 12 hours prior to administration of PDE4 inhibitors. Following administration of a PDE4 inhibitor, emetic and behavioral responses were quantified for three hours post dosing. The total number of emetic responses  
20 and vomiting episodes were quantified during the observation interval. In addition, latency time to first emetic episode, duration of emesis episodes, and gross behavioral changes including ataxia, profuse and viscous salivation, mouth clawing, hyper-  
25 ventilation, backward walking, flattened body posture, hyperactivity, lip licking, and general appearance were recorded.

For comparative purposes, the emetogenic effect of Samples 66 and 69 were tested intra-  
30 venously at 1.0, 2.5, 5.0, and 10 mg/kg and orally at 2.5, 10, 17, and 25 mg/kg. The results are summarized in the following table:

<sup>1)</sup> Only two ferrets were dosed intravenously with 5 mg/kg compound (A) because of the severity of the responses. Therefore, 10 mg/kg Example 8 (A) was not administered intravenously.

In general, both compounds (C) and (A), delivered either orally or via intravenous injection, produced a clear dose response in terms of emetic behavior. Compound (A) produced a much  
5 stronger emetic response than compound (C). This was readily apparent when the responses to oral dosing was compared. For example, at a dose of 25 mg/kg body weight, compound (A) produced more retching and vomiting episodes than the same oral dose of  
10 compound (C). In addition, the number of retches and vomiting events per episode was much greater for compound (A) than compound (C) in this dose group. A similar trend was apparent at oral dosages of 17 and 11 mg/kg body weight, with compound (A) exhibit-  
15 ing a stronger response than compound (C). There were no apparent differences observed between the lowest dosed groups for both molecules. In these cases, some minor lip licking/mouth pawing was evident with both compounds, but no emetic responses  
20 were observed.

The results of oral dosing contrast markedly with that of intravenous dosing. At an intravenous dose of 5 mg/kg body weight of compound (A), one of the tested animals died almost immediately  
25 after dosing (within 5 minutes), whereas the second animal was clearly distressed, but recovered after 3 hours. The distress can be attributed either to an acute toxicity event or to an exaggerated pharmacological response to centrally mediated emesis. It  
30 also was noted that the distressed and labored breathing in these dosed animals was difficult to distinguish from extreme retching behavior. The effects were not nearly as severe with intravenous

administration of compound (C) as shown in the above table. Although all animals exhibited emetic behavior at the 10 mg/kg body weight dose with compound (C), none displayed the distress associated  
5 with the 5 mg/kg dose of compound (A). With the exception of the 5 mg/kg body weight dose of compound (A), all of the animals recovered from their treatment and appeared normal.

The results summarized in the above tables show that the compounds of the present invention are useful for selectively inhibiting PDE4 activity in a mammal, without exhibiting the adverse CNS and emetic effects associated with prior PDE4 inhibitors.

Obviously, many modifications and variations of the invention as hereinbefore set forth can be made without departing from the spirit and scope thereof and, therefore, only such limitations should be imposed as are indicated by the appended claims.
